Weighted $L^p$ for $p \in (1, \infty)$ and weak-type endpoint estimates with general weights are established for commutators of the Hardy-Littlewood maximal operator with BMO symbols on spaces of homogeneous type. As an application, a weighted weak-type endpoint estimate is proved for maximal operators associated with commutators of singular integral operators with BMO symbols on spaces of homogeneous type. All results with no weight on spaces of homogeneous type are also new.

1. Introduction

We will be working on a space of homogeneous type. Let $X$ be a set endowed with a positive Borel regular measure $\mu$ and a symmetric quasimetric $d$ satisfying that there exists a constant $\kappa \geq 1$ such that for all $x, y, z \in X$, $d(x, y) \leq \kappa [d(x, z) + d(z, y)]$. The triple $(X, d, \mu)$ is said to be a space of homogeneous type in the sense of Coifman and Weiss [1] if $\mu$ satisfies the following doubling condition: there exists a constant $C \geq 1$ such that for all $x \in X$ and $r > 0$,

$$\mu(B(x, 2r)) \leq C \mu(B(x, r)).$$

(1.1)

It is easy to see that the above doubling property implies the following strong homogeneity: there exist positive constants $C$ and $n$ such that for all $\lambda \geq 1$, $r > 0$, and $x \in X$,

$$\mu(B(x, \lambda r)) \leq C \lambda^n \mu(B(x, r)).$$

(1.2)
Moreover, there also exist constants $C > 0$ and $N \in [0, n]$ such that for all $x, y \in \mathcal{X}$ and $r > 0$,
\[ \mu(B(y, r)) \leq C \left( 1 + \frac{d(x, y)}{r} \right)^N \mu(B(x, r)). \tag{1.3} \]

We remark that although all balls defined by $d$ satisfy the axioms of complete system of neighborhoods in $\mathcal{X}$, and therefore induce a (separated) topology in $\mathcal{X}$, the balls $B(x, r)$ for $x \in \mathcal{X}$ and $r > 0$ need not be open with respect to this topology. However, by a remarkable result of Macías and Segovia in [2], we know that there exists another quasimetric $\tilde{d}$ such that

(i) there exists a constant $C > 1$ such that for all $x, y \in \mathcal{X}$, $\frac{1}{C} \tilde{d}(x, y) \leq d(x, y) \leq C \tilde{d}(x, y)$;

(ii) there exist constants $C > 0$ and $\gamma \in (0, 1]$ such that for all $x, x', y \in \mathcal{X}$,
\[ |\tilde{d}(x, y) - \tilde{d}(x', y)| \leq C(\tilde{d}(x, x'))^{1-\gamma}(\tilde{d}(x, y) + \tilde{d}(x', y))^{1-\gamma}. \tag{1.4} \]

The balls corresponding to $\tilde{d}$ are open in the topology induced by $d$. Thus, throughout this paper, we always assume that there exist constants $C > 0$ and $\gamma \in (0, 1]$ such that for all $x, x', y \in \mathcal{X}$,
\[ |d(x, y) - d(x', y)| \leq C(d(x, x'))^{1-\gamma}(d(x, y) + d(x', y))^{1-\gamma}, \tag{1.5} \]
and that the balls $B(x, r)$ for all $x \in \mathcal{X}$ and $r > 0$ are open.

Now let $k$ be a positive integer and $b \in \text{BMO}(\mathcal{X})$, define the $k$th-order commutator $M_{b,k}$ of the Hardy-Littlewood maximal operator with $b$ by
\[ M_{b,k}f(x) = \sup_{B \ni x} \frac{1}{\mu(B)} \int_B |b(y) - b(y_0)|^k |f(y)| d\mu(y) \tag{1.6} \]
for all $x \in \mathcal{X}$. For the case that $(\mathcal{X}, d, \mu)$ is the Euclidean space, García-Cuerva et al. [3] proved that $M_{b,k}$ is bounded on $L^p(\mathbb{R}^n)$ for any $p \in (1, \infty)$, and Alphonse [4] proved that $M_{b,1}$ enjoys a weak-type $L(\log L)$ estimate, that is, there exists a positive constant $C$, depending on $\|b\|_{\text{BMO}(\mathbb{R}^n)}$, such that for all suitable functions $f$,
\[ \left| \left\{ x \in \mathbb{R}^n : M_{b,1}f(x) > \lambda \right\} \right| \leq C \int_{\mathbb{R}^n} \frac{|f(x)|}{\lambda} \log \left( e + \frac{|f(x)|}{\lambda} \right) dx. \tag{1.7} \]

Li et al. [5] established a weighted estimate with any general weight for $M_{b,1}$ in $\mathbb{R}^n$. As it was shown in [3–5] for the setting of Euclidean spaces, the operator $M_{b,k}$ plays an important role in the study of commutators of singular integral operators with BMO symbols. In this paper, we establish weighted estimates with general weights for $M_{b,k}$ in spaces of homogeneous type. To state our results, we first give some notation.

Let $E$ be a measurable set with $\mu(E) < \infty$. For any fixed $p \in [1, \infty)$, $\delta > 0$, and suitable function $f$, set
\[ \|f\|_{L^p(\log L)^\delta, E} = \inf_{\lambda > 0} \left\{ \lambda > 0 : \frac{1}{\mu(E)} \int_E \left( \frac{|f(x)|}{\lambda} \right)^p \log^\delta \left( e + \frac{|f(x)|}{\lambda} \right) d\mu(x) \leq 1 \right\}. \tag{1.8} \]

The maximal operator $M_{L^p(\log L)^\delta}$ is defined by
\[ M_{L^p(\log L)^\delta}f(x) = \sup_{B \ni x} \|f\|_{L^p(\log L)^\delta, B}, \]
where the supremum is taken over all balls containing $x$. In the following, we denote $M_{L^p(\log L)^\delta}$ by $M_{L^p} \delta$ for simplicity, and denote by $L^\infty_b(\mathcal{X})$ the set of bounded functions with bounded support.

With the notation above, we now formulate our main results as follows.
Theorem 1.1. Let $k$ be a positive integer, $p \in (1, \infty)$, and $b \in \text{BMO}(\mathcal{X})$. Then for any $\delta > 0$, there exists a positive constant $C$, depending only on $p$, $k$, and $\delta$, such that for all nonnegative weights $w$ and $f \in L^\infty_b(\mathcal{X})$,

$$\int_{\mathcal{X}} (M_{b,k}f(x))^p w(x)d\mu(x) \leq C\|b\|_{\text{BMO}(\mathcal{X})}^k \int_{\mathcal{X}} |f(x)|^p M_{L^1(\log L)^{k+p}} w(x)d\mu(x). \quad (1.9)$$

Theorem 1.2. Let $k$ be a positive integer, $b \in \text{BMO}(\mathcal{X})$, and $\delta > 0$. There exists a positive constant $C = C_{k,\|b\|_{\text{BMO}(\mathcal{X})}}$ such that for all nonnegative weights $\omega$, $f \in L^\infty_b(\mu)$ and $\lambda > 0$,

$$\omega(\{x \in \mathcal{X} : M_{b,k}f(x) > \lambda\}) \leq C \int_{\mathcal{X}} \frac{|f(x)|}{\lambda} \log^k \left(1 + \frac{|f(x)|}{\lambda}\right) M_{L^1(\log L)^{k+\delta}} \omega(x)d\mu(x), \quad (1.10)$$

where, and in the following, $\tilde{k} = k$ if $k$ is even and $\tilde{k} = k + 1$ if $k$ is odd.

As a corollary of Theorem 1.2, we establish a weighted endpoint estimate for the maximal commutator of singular integral operators with BMO symbols. Let $T$ be a Calderón-Zygmund operator, that is, $T$ is a linear $L^2(\mathcal{X})$-bounded operator and satisfies that for all $f \in L^2(\mathcal{X})$ with bounded support and almost all $x \not\in \text{supp} f$,

$$Tf(x) = \int_{\mathcal{X}} K(x, y)f(y)d\mu(y), \quad (1.11)$$

where $K$ is a locally integrable function on $\mathcal{X} \times \mathcal{X} \setminus \{(x, y) : x = y\}$ and satisfies that for all $x \neq y$,

$$|K(x, y)| \leq \frac{C}{\mu(B(x, d(x, y)))}, \quad (1.12)$$

and that for all $x, y, y' \in \mathcal{X}$ with $d(x, y) \geq 2d(y, y')$,

$$|K(x, y) - K(x, y')| + |K(y, x) - K(y', x)| \leq C \frac{(d(y, y'))^{\tau}}{\mu(B(x, d(x, y))) (d(x, y))^\tau} \quad (1.13)$$

with positive constants $C$ and $\tau \leq 1$. For any $\epsilon > 0$, suitable function $f$ and $x \in \mathcal{X}$, define the truncated operator $T_\epsilon$ by

$$T_\epsilon f(x) = \int_{d(x, y) > \epsilon} K(x, y)f(y)d\mu(y). \quad (1.14)$$

Let $b \in \text{BMO}(\mathcal{X})$ and let $k$ be a positive integer. Define the commutator $T_{eb,k}$ by

$$T_{eb,0}f(x) = T_\epsilon f(x), T_{eb,k}f(x) = b(x)T_{eb,k-1}f(x) - T_{eb,k-1}(bf)(x) \quad (1.15)$$

for all $x \in \mathcal{X}$ and $f \in L^\infty_b(\mathcal{X})$. The maximal operator associated with the commutator $T_{b,k}$ is defined by

$$T_{b,k}^*f(x) = \sup_{\epsilon > 0} |T_{eb,k}f(x)| \quad (1.16)$$
for all $x \in X$. In [6], it was proved that if $T$ is a Calderón-Zygmund operator, then for any $p \in (1, \infty)$, there exists a positive constant $C$ such that for all $f \in L^p(X)$ and all nonnegative weights $w$,

$$
\int_X |T^*_b f(x)|^p w(x) d\mu(x) \leq C \|b\|_{\text{BMO}(\mu)}^p \int_X |f(x)|^p M_{L(\log L)^{k+1/p}} w(x) d\mu(x). \tag{1.17}
$$

In [5], it was proved that in $\mathbb{R}^n$, $T^*_b$ enjoys the following weighted weak-type endpoint estimate: for any $\delta > 0$, there exists a positive constant $C$, depending on $n, \delta$, and $\|b\|_{\text{BMO}(\mathbb{R}^n)}$, such that

$$
\omega(\{x \in \mathbb{R}^n : T^*_b f(x) > \lambda\}) \leq C \int_{\mathbb{R}^n} \frac{|f(x)|}{\lambda} \log \left(1 + \frac{|f(x)|}{\lambda}\right) M_{L(\log L)^{k+1}} w(x) dx. \tag{1.18}
$$

Using Theorem 1.2, we will prove the following result.

**Theorem 1.3.** Let $T$ be a Calderón-Zygmund operator. Then for any $b \in \text{BMO}(X)$, nonnegative integer $k$ and $\delta > 0$, there exists a positive constant $C$, depending on $k, \delta$, and $\|b\|_{\text{BMO}(X)}$, such that for all $\lambda > 0$, $f \in L^\infty(X)$ and nonnegative weights $w$,

$$
\int_{\{x \in X : |T^*_b f(x)| > \lambda\}} w(x) d\mu(x) \leq C \int_X \frac{|f(x)|}{\lambda} \log^k \left(1 + \frac{|f(x)|}{\lambda}\right) M_{L(\log L)^{k+1}} w(x) d\mu(x). \tag{1.19}
$$

We mention that Theorems 1.1, 1.2, and 1.3 are also new even when $w(x) \equiv 1$ for all $x \in X$.

We now make some conventions. Throughout the paper, we always denote by $C$ a positive constant which is independent of main parameters, but it may vary from line to line. We denote $f \leq C g$ and $f \geq C g$ simply by $f \lesssim g$ and $f \gtrsim g$, respectively. If $f \lesssim g \lesssim f$, we then write $f \sim g$. Constant, with subscript such as $C_1$, does not change in different occurrences. A weight $w$ always means a nonnegative locally integrable function. For a measurable set $E$ and a weight $w$, $\chi_E$ denotes the characteristic function of $E$, $w(E) = \int_E w(x) d\mu(x)$. Given $\lambda > 0$ and a ball $B$, $\lambda B$ denotes the ball with the same center as $B$ and whose radius is $\lambda$ times that of $B$. For a fixed $p$ with $p \in (1, \infty)$, $p'$ denotes the dual exponent of $p$, namely, $p' = p/(p-1)$. For any measurable set $E$ and any integrable function $f$ on $E$, we denote by $m_E(f)$ the mean value of $f$ over $E$, that is, $m_E(f) = (1/\mu(E)) \int_E f(x) d\mu(x)$. For any locally integrable function $f$ and $x \in X$, the Fefferman-Stein sharp maximal function $M^s f(x)$ is defined by

$$
M^s f(x) = \sup_{B \ni x} \frac{1}{\mu(B)} \int_B |f(y) - m_B(f)| d\mu(y), \tag{1.20}
$$

where the supremum is taken over all balls $B$ containing $x$. For any fixed $q \in (0, 1)$, the sharp maximal function $M^q f$ of the function $f$ is defined by $M^q f = (M^q(|f|^q))^{1/q}$.

A generalization of Hölder’s inequality will be used in the proofs of our theorems. For any measurable set $E$ with $\mu(E) < \infty$, positive integer $l$, and suitable function $f$, set

$$
\|f\|_{L^{1/l}, E} = \inf \left\{ \lambda > 0 : \frac{1}{\mu(E)} \int_E \left(\frac{|f(x)|}{\lambda}\right)^{1/l} d\mu(x) \leq 2 \right\}. \tag{1.21}
$$

Then the following generalization of Hölder’s inequality:

$$
\frac{1}{\mu(E)} \int_E |f(x)h(x)| d\mu(x) \leq C \|f\|_{L(\log L)^l, E} \|h\|_{L^{1/l}, E} \tag{1.22}
$$

holds for any suitable functions $f$ and $h$; see [7] for details.
Guoen Hu et al.

2. Proof of Theorem 1.1

To prove Theorem 1.1, we need some technical lemmas. In what follows, we denote by \( M \) the Hardy-Littlewood maximal function. Moreover, for any \( s > 0 \) and suitable function \( f \), we set \( M_s(f) = \left[ M(|f|^s) \right]^{1/s} \).

**Lemma 2.1** (see [8]). There exists a positive constant \( C \) such that for all weights \( w \) and all nonnegative functions \( f \) satisfying \( \mu((x \in \mathcal{X} : f(x) > \lambda)) < \infty \) for all \( \lambda > 0 \), then

(i) if \( \mu(\mathcal{X}) = \infty \),

\[
\int_{\mathcal{X}} f(x)w(x)d\mu(x) \leq C \int_{\mathcal{X}} M^s f(x)w(x)d\mu(x);
\]

(ii) if \( \mu(\mathcal{X}) < \infty \),

\[
\int_{\mathcal{X}} f(x)w(x)d\mu(x) \leq C \int_{\mathcal{X}} M^s f(x)w(x)d\mu(x) + Cw(\mathcal{X})m_{\mathcal{X}}(f).
\]

**Lemma 2.2.** For any \( q \in (0, 1) \), there exists a positive constant \( C \) such that for all \( f \in L^p(\mathcal{X}) \) with \( p \in [1, \infty) \) and all \( x \in \mathcal{X} \), \( M^q_f(x)(x) \leq CM^q f(x) \).

For the case that \( (\mathcal{X}, d, \mu) \) is the Euclidean space, this lemma was proved in [9]. For spaces of homogeneous type, the proof is similar to the case of Euclidean spaces; see [6].

**Lemma 2.3.** Let \( p \in (1, \infty) \) and let \( k \) be a positive integer.

(a) There exists a positive constant \( C \), depending only on \( k \) and \( p \), such that for all \( f \in L^\infty(\mathcal{X}) \) and all weights \( w \),

\[
\int_{\mathcal{X}} [M_{L(\log L)}f(x)]^p w(x)d\mu(x) \leq C \int_{\mathcal{X}} |f(x)|^p Mw(x)d\mu(x).
\]

(b) For any \( \delta_1 > 0 \), there exists a positive constant \( C \), depending only on \( k \), \( p \), and \( \delta_1 \), such that for all \( f \in L^\infty(\mathcal{X}) \) and all weights \( w \),

\[
\int_{\mathcal{X}} (M^k f(x))^p [M_{L(\log L)}^\gamma w(x)]^{1-p} d\mu(x) \leq C \int_{\mathcal{X}} |f(x)|^p [w(x)]^{1-p} d\mu(x).
\]

For Euclidean spaces, Lemma 2.3(a) is just Corollary 1.8 in [10] and Lemma 2.3(b) is included in the proof of Theorem 2 in [11] together with (4.11) in [12]. For spaces of homogeneous type, Lemma 2.3(a) is a simple corollary of Theorem 1.4 in [13]. On the other hand, by Theorem 1.4 in [13], and the estimate that for all weights \( w \), \( M_{L(\log L)}^\gamma w = M^{k+1}_w \) (see [12]), we can prove Lemma 2.3(b) by the ideas used in [11, page 751]. For details, see [6].

By a similar argument that was used in the proof of Theorem 2.1 in [14], we can verify the existence of the following approximation of the identity of order \( \gamma \) with bounded support on \( \mathcal{X} \). We omit the details here.

For any \( x \in \mathcal{X} \) and \( r > 0 \), set \( V_r(x) = \mu(B(x, r)) \).
Lemma 2.4. Let $\gamma$ be as in (1.5). Then there exists an approximation of the identity $\{S_k\}_{k \in \mathbb{Z}}$ of order $\gamma$ with bounded support on $\mathcal{X}$. Namely, $\{S_k\}_{k \in \mathbb{Z}}$ is a sequence of bounded linear integral operators on $L^2(\mathcal{X})$, and there exist constants $C_0, \bar{C} > 0$ such that for all $k \in \mathbb{Z}$ and all $x, x', y, y' \in \mathcal{X}$, $S_k(x, y)$, the integral kernel of $S_k$ is a measurable function from $\mathcal{X} \times \mathcal{X}$ into $\mathbb{C}$ satisfying

(i) $S_k(x, y) = 0$ if $d(x, y) > 2^{-k}$ and $0 \leq S_k(x, y) \leq C_0(1/(V_{2^{k+1}}(x) + V_{2^{k+1}}(y)))$;

(ii) $S_k(x, y) = S_k(y, x)$ for all $x, y \in \mathcal{X}$;

(iii) $|S_k(x, y) - S_k(x', y)| \leq C_02^{k+1}d(x, x')^{\gamma}(1/(V_{2^{k+1}}(x) + V_{2^{k+1}}(y)))$ for $d(x, x') \leq \max\{\bar{C}/\kappa, 1/\kappa\}2^{1-k}$;

(iv) $C_0V_{2^{k+1}}(x)S_k(x, y) > 1$ for all $x \in \mathcal{X}$ and $k \in \mathbb{Z}$;

(v) $\int_{\mathcal{X}} S_k(x, y)d\mu(y) = 1 = \int_{\mathcal{X}} S_k(x, y)d\mu(x)$.

For any $\varepsilon > 0$ and $x, y \in \mathcal{X}$, let

$$S_{\varepsilon}(x, y) = S_k(x, y)\chi_{\varepsilon(2^{k+1}, 2^{k+1})}(\varepsilon).$$

(2.5)

Obviously, $S_{\varepsilon}$ satisfies (i) through (v) of Lemma 2.4 with $2^{-k}$ replaced by $\varepsilon$. From (iii) and (iv) of Lemma 2.4, it follows that there exist constants $C^* \in (0, \min\{C/\kappa, 1/\kappa, (C_0)^{-2/\gamma}\})$ and $C > 1$ such that for all $\varepsilon > 0$ and all $x, y \in \mathcal{X}$ satisfying $d(x, y) < C\varepsilon$,

$$CV_{\varepsilon}(x)S_{\varepsilon}(x, y) > 1.$$  

(2.6)

For a positive integer $k$ and a function $b \in \text{BMO}(\mathcal{X})$, let $\widetilde{M}_{b,k}$ be the operator defined by

$$\widetilde{M}_{b,k}f(x) = \sup_{\varepsilon > 0}\widetilde{M}_{\varepsilon,b,k}f(x)$$

(2.7)

for all $f \in L^\infty_b(\mathcal{X})$ and $x \in \mathcal{X}$, where for $\varepsilon > 0$,

$$\widetilde{M}_{\varepsilon,b,k}f(x) = \int_{\mathcal{X}} S_{\varepsilon}(x, y)|b(x) - b(y)|^k|f(y)|d\mu(y).$$

(2.8)

If $k = 0$, we denote $\widetilde{M}_{b,k}$ and $\widetilde{M}_{\varepsilon,b,k}$ simply by $\widetilde{M}$ and $\widetilde{M}_{\varepsilon}$, respectively. From (i) of Lemma 2.4 together with (1.1), it follows that $S_{\varepsilon}(x, y) \lesssim 1/V_{\varepsilon}(x) \lesssim 1/V_{2\varepsilon}(x)$. Notice that if $d(x, y) \geq 2\varepsilon$, then $S_{\varepsilon}(x, y) = 0$. Thus,

$$\widetilde{M}_{b,k}f(x) = \sup_{\varepsilon > 0}\widetilde{M}_{\varepsilon,b,k}f(x) \lesssim \sup_{\varepsilon > 0}\frac{1}{V_{2\varepsilon}(x)}\int_{B(x, 2\varepsilon)} |b(x) - b(y)|^k|f(y)|d\mu(y) \lesssim M_{b,k}f(x).$$

(2.9)

On the other hand, for each fixed $\varepsilon > 0$, by (2.6) and $V_{C\varepsilon}(x)-V_{\varepsilon}(x)$, we have

$$\frac{1}{V_{C\varepsilon}(x)}\int_{B(x, C\varepsilon)} |b(x) - b(y)|^k|f(y)|d\mu(y) \lesssim \int_{\mathcal{X}} S_{\varepsilon}(x, y)|b(x) - b(y)|^k|f(y)|d\mu(y) \lesssim \widetilde{M}_{b,k}f(x).$$

(2.10)

By the definition of $M_{b,k}$, we further obtain $M_{b,k}f(x) \lesssim \widetilde{M}_{b,k}f(x)$. Thus, there exists some constant $C \geq 1$ such that for all $x \in \mathcal{X}$ and $f \in L^\infty_b(\mathcal{X})$,

$$C^{-1}\widetilde{M}_{b,k}f(x) \leq M_{b,k}f(x) \leq C\widetilde{M}_{b,k}f(x).$$

(2.11)

For the sharp function estimate of $\widetilde{M}_{b,k}$, we have the following estimate.
Lemma 2.5. Let k be a positive integer and $b \in \text{BMO}(\mathcal{X})$. For any $q$ and s with $0 < q < s < 1$, there exists a positive constant $C$ such that for all $f \in L^q_\infty(\mathcal{X})$ and all $x \in \mathcal{X}$,

$$M^k_q(\overline{M}_{b,k} f)(x) \leq C \sum_{j=0}^{k-1} \|b\|_{\text{BMO}(\mathcal{X})}^{k-j} M_s(\overline{M}_{b,j} f)(x) + C \|b\|_{\text{BMO}(\mathcal{X})}^{k} M_{L(\log L)} f(x). \quad (2.12)$$

Proof. By (i), (ii), and (iii) of Lemma 2.4, we obtain that for all $x, y \in \mathcal{X}$,

$$|S_\epsilon(x, y)| \lesssim \frac{1}{\mu(B(x, d(x, y)))}, \quad (2.13)$$

and that for all $\epsilon > 0$ and all $x, y, y' \in \mathcal{X}$ with $d(x, y) \geq 2\kappa d(y, y')$,

$$|S_\epsilon(x, y) - S_\epsilon(x, y')| + |S_\epsilon(y, x) - S_\epsilon(y', x)| \lesssim \frac{1}{\mu(B(x, d(x, y)))} \left( \frac{d(y, y')}{d(x, y)} \right). \quad (2.14)$$

To verify (2.12), by homogeneity, we may assume that $\|b\|_{\text{BMO}(\mathcal{X})} = 1$. For all $f \in L^q_\infty(\mathcal{X})$, $x \in \mathcal{X}$, and balls $B$ containing $x$, it suffices to prove that

$$\inf_{c \in \mathbb{C}} \left( \frac{1}{\mu(B)} \int_B |\overline{M}_{b,k} f(y) - c|^q d\mu(y) \right)^{1/q} \lesssim \sum_{j=0}^{k-1} M_s(\overline{M}_{b,j} f)(x) + M_{L(\log L)} f(x). \quad (2.15)$$

We consider the following three cases.

Case 1 ($\mu(\mathcal{X} \setminus C_1 B) = 0$). Where and in what follows $C_1 = \kappa(4\kappa + 1)$. In this case, we have that for all $x \in \mathcal{X}$,

$$\overline{M}_{b,k} f(x) \lesssim \sum_{j=0}^{k-1} |m_B(b) - b(x)|^{k-j} \overline{M}_{b,j} f(x) + \overline{M}((b - m_B(b))^k) f(x). \quad (2.16)$$

The Kolmogorov inequality (see [15, page 102]), along with the fact that $M$ (and so $\overline{M}$) is bounded from $L^1(\mathcal{X})$ to $L^{1,\infty}(\mathcal{X})$ and the inequality (1.22) gives us that

$$\left\{ \frac{1}{\mu(B)} \int_B \left| \overline{M}((b - m_B(b))^k) f(y) \right|^q d\mu(y) \right\}^{1/q} \lesssim \frac{1}{\mu(B)} \int_{C_1 B} |b(y) - m_B(b)|^k |f(y)| d\mu(y)$$

$$\lesssim \frac{1}{\mu(B)} \int_{C_1 B} |b(y) - m_{C_1 B}(b)|^k |f(y)| d\mu(y) + |m_{C_1 B}(b) - m_B(b)| \frac{1}{\mu(B)} \int_{C_1 B} |f(y)| d\mu(y)$$

$$\lesssim M_{L(\log L)} f(x), \quad (2.17)$$

where the last inequality follows from the John-Nirenberg inequality, which states that for any ball $Q$,

$$\|m_Q(b) - b\|^k_{\exp L^{1,\infty},Q} \lesssim \|b\|_{\text{BMO}(\mathcal{X})}^k. \quad (2.18)$$
On the other hand, if $0 < q < s < 1$, an application of Holder’s inequality implies that

\[
\left\{ \frac{1}{\mu(B)} \int_B [\widetilde{M}_{b,k} f(x)]^q d\mu(x) \right\}^{1/q} \leq \sum_{j=0}^{k-1} M_s(\widetilde{M}_{b,j} f)(x) + \left\{ \frac{1}{\mu(B)} \int_B [\widetilde{M}((b - m_B(b))^k f)(y)]^q d\mu(y) \right\}^{1/q}.
\] (2.19)

We then get (2.15).  

Case 2 ($\mu(\mathcal{X} \setminus C_1 B) \neq 0$ and $\mu(C_1 B \setminus B) > 0$). In this case, decompose $f$ into $f = f_1 + f_2$, recalling that $\chi_E$ denotes the characteristic function of the set $E$. Let $y_0$ be a point in $B$ such that

\[
C_B \equiv \sup_{\epsilon > 0} \int_{\mathcal{X}} S_\epsilon(y_0, z) |m_B(b) - b(z)|^k |f_2(z)| dz < \infty.
\] (2.20)

With the aid of the formula

\[
(m_B(b) - b(z))^k = (b(y) - b(z))^k + \sum_{j=0}^{k-1} C^j_k (b(y) - b(z))^j (m_B(b) - b(y))^{k-j},
\] (2.21)

where $C^j_k$ is the constant from Newton’s formula, we have

\[
\left| |b(y) - b(z)|^k |f(z)| - |m_B(b) - b(z)|^k |f_2(z)| \right| \lesssim \sum_{j=0}^{k-1} |b(y) - b(z)|^j |m_B(b) - b(y)|^{k-j} |f(z)| + |m_B(b) - b(z)|^k |f_1(z)|.
\] (2.22)

Thus for any $y \in B$,

\[
|\widetilde{M}_{b,k} f(y) - C_B| = \left| \sup_{\epsilon > 0} |\widetilde{M}_{\epsilon:b,k} f(y)| - \sup_{\epsilon > 0} |\widetilde{M}_{\epsilon}((m_B(b) - b)^k f_2)(y_0)| \right| \\
\lesssim \sup_{\epsilon > 0} |\widetilde{M}_{\epsilon:b,k} f(y) - \widetilde{M}_{\epsilon}((m_B(b) - b)^k f_2)(y_0)| \\
\lesssim \widetilde{M}((m_B(b) - b)^k f_1)(y) + \sum_{j=0}^{k-1} |m_B(b) - b(y)|^{k-j} |\widetilde{M}_{b,j} f(y)| \\
\leq I(y) + II(y) + III(y).
\] (2.23)

As in Case 1, we have that

\[
\left\{ \frac{1}{\mu(B)} \int_B |I(y)|^q d\mu(y) \right\}^{1/q} \lesssim M_{L(\log L)^k} f(x),
\]

\[
\left\{ \frac{1}{\mu(B)} \int_B |II(y)|^q d\mu(y) \right\}^{1/q} \lesssim \sum_{j=0}^{k-1} M_s(\widetilde{M}_{b,j} f)(x).
\] (2.24)
As for III (y), by (2.14) and (1.22), it is easy to get

\[
\text{III} (y) \leq \sup_{c > 0} \int_{\mathcal{X}} |S_{c}(y, z) - S_{c}(y_{0}, z)| |m_{B}(b) - b(z)|^{k} \cdot |f_{2}(z)| \, d\mu(z)
\]

\[
\lesssim \int_{\mathcal{X} \setminus C_{1}B} \frac{(d(y, y_{0}))^{\gamma}}{\mu(B(y, d(y, y_{0})))} |m_{B}(b) - b(z)|^{k} \cdot |f(z)| \, d\mu(z)
\]

\[
\lesssim \sum_{l=1}^{\infty} 2^{-l} \mu(\mathcal{C}_{l}B) \int_{\mathcal{C}_{l}B} |m_{2C_{l}B}(b) - b(z)|^{k} \cdot |f(z)| \, d\mu(z)
\]

\[
\quad + \sum_{l=1}^{\infty} 2^{-l} \cdot |m_{2C_{l}B}(b) - b(z)|^{k} \int_{\mathcal{C}_{l}B} |f(z)| \, d\mu(z)
\]

\[
\lesssim \sum_{l=1}^{\infty} 2^{-l} \cdot |m_{2C_{l}B}(b) - b(z)|^{k} \int_{\mathcal{C}_{l}B} |f(z)| \, d\mu(z)
\]

\[
\quad + \sum_{l=1}^{\infty} 2^{-l} \cdot |m_{2C_{l}B}(b) - b(z)|^{k} \cdot Mf(x) \lesssim M_{\log \log} f(x),
\]

where the last inequality follows from (2.18) and \(|m_{2Q}(b) - m_{Q}(b)| \lesssim 1\). This leads to our desired estimate (2.15).

Case 3 \((\mathcal{X} \setminus C_{1}B) \neq 0\) and \(C_{1}B \setminus B = 0\). In this case, we take \(B'\) such that \(B \subset B'\), \(\mu(B') = \mu(B)\), and \(\mu(C_{1}B \setminus B') > 0\). We then have that

\[
\inf_{c \in \mathbb{C}} \frac{1}{\mu(B')} \int_{B'} |\overline{M}_{b,k}f(x) - c|^{q} \, d\mu(x) \leq \inf_{c \in \mathbb{C}} \frac{1}{\mu(B')} \int_{B'} |\overline{M}_{b,k}f(x) - c|^{q} \, d\mu(x).
\]

With the ball \(B\) replaced by \(B'\) in Case 2, we also obtain the result that for any \(y \in B'\),

\[
\sup_{c > 0} \int_{\mathcal{X}} |S_{c}(y, z) - S_{c}(y_{0}, z)| |m_{B}(b) - b(z)|^{k} \cdot |f_{2}(z)| \, dz \leq CM_{\log \log} f(x),
\]

which completes the proof of Lemma 2.5. \(
\)

**Lemma 2.6.** Let \(\alpha, \beta \in [0, \infty)\). There exists a positive constant \(C\), depending only on \(\alpha\) and \(\beta\), such that for all weights \(\omega\),

\[
M_{\log \log} \left( M_{\log \log} \omega \right)(x) \leq CM_{\log \log} \omega(x).
\]

For Euclidean spaces, a generalization of Lemma 2.6 was proved in [16]. For spaces of homogeneous type, by a standard argument involving a covering lemma in [17, page 138], we have that for any \(\lambda > 0\) and suitable function \(f\),

\[
\mu\left( \{ x \in \mathcal{X} : M_{\log \log} f(x) > \lambda \} \right) \lesssim \int_{\mathcal{X}} \frac{|f(x)|}{\lambda} \log^{\alpha} \left( e + \frac{|f(x)|}{\lambda} \right) \, d\mu(x).
\]

Using this, Lemma 2.6 can be proved by applying the ideas used in [16]. For details, see [6, Lemma 7].
\textbf{Proof of Theorem 1.1.} We assume again that $\|b\|_{\text{MO}(\mathcal{K})} = 1$. At first, we claim that when $\mu(\mathcal{K}) = \infty$, for all $\lambda > 0$ and $f \in L^p_w(\mathcal{K})$, $\mu(\{x \in \mathcal{K} : \overline{M}_{b,k}(x) > \lambda\}) < \infty$. In fact, for any $f \in L^p_w(\mathcal{K})$, let $R$ be large enough such that $\text{supp } f \subset B(x_0, R)$ for some $x_0 \in \mathcal{K}$. Notice that for all $x \in \mathcal{K} \setminus B(x_0, 3R)$,

$$
Mf(x) \lesssim \frac{\|f\|_{L^1(\mathcal{K})}}{\mu(B(x, d(x,x_0)))}.
$$

(2.30)

It then follows that for $p \in (1, \infty)$,

$$
\begin{align*}
\mu(\{x \in \mathcal{K} \setminus B(x_0, 3R) : |b(x) - m_{B(x_0, R)}(b)|^k Mf(x) > \lambda\}) \\
&\leq \lambda^{-p} \int_{\mathcal{K} \setminus B(x_0, 3R)} |b(x) - m_{B(x_0, R)}(b)|^k (Mf(x))^p d\mu(x) \\
&\leq \lambda^{-p} \|f\|_{L^1(\mathcal{K})} \int_{\mathcal{K} \setminus B(x_0, 3R)} |b(x) - m_{B(x_0, d(x,x_0))}(b)|^k \mu(B(x, d(x,x_0)))^p d\mu(x) < \infty.
\end{align*}
$$

(2.31)

This, together with the estimate that

$$
\mu(\{x \in \mathcal{K} : M((b - m_{B(x_0, R)}(b))^k f)(x) > \lambda\}) \lesssim \lambda^{-p} \|b - m_{B(x_0, R)}(b)|^k f\|_{L^p(\mathcal{K})}^p < \infty,
$$

leads to our claim.

By (2.11), to prove Theorem 1.1, it suffices to prove that for all weights $w$,

$$
\int_{\mathcal{K}} (\overline{M}_{b,k}(f(x))^p w(x) d\mu(x) \lesssim \int_{\mathcal{K}} |f(x)|^p M_{L(\log L)^{\sigma}} w(x) d\mu(x).
$$

(2.33)

We proceed our proof by an inductive argument on $k$. When $k = 0$, (2.33) is implied by the fact that $Mw(x) \leq M_{L(\log L)^{\sigma}} w(x)$ for all $x \in \mathcal{K}$ and the following known inequality:

$$
\int_{\mathcal{K}} (\overline{M}f(x))^p w(x) d\mu(x) \lesssim \int_{\mathcal{K}} |f(x)|^p Mw(x) d\mu(x).
$$

(2.34)

See [18, pages 150-151], for a proof of the last inequality when $\mathcal{K} = \mathbb{R}^n$. The same ideas also work for $\mathcal{K}$. Now we assume that $k$ is a positive integer and (2.33) holds for any integer $l$ with $0 \leq l \leq k - 1$. Then $\overline{M}_{b,l}(0 \leq l \leq k - 1)$ can extend to a bounded operator on $L^p(\mathcal{K})$ for $p \in (1, \infty)$ and so for any $\lambda > 0$ and $\sigma \in (0, 1)$,

$$
\mu(\{x \in \mathcal{K} : M((\overline{M}_{b,l} f)\sigma)(x) > \lambda\}) < \infty.
$$

(2.35)

We now prove (2.33). To begin with, we prove that for any given $q \in (0, 1)$ and $k \in \mathbb{N}$, and for all weights $h$ and all $f \in L^\infty_w(\mathcal{K})$,

$$
\int_{\mathcal{K}} (\overline{M}_{b,k}(f(x))^q h(x) d\mu(x) \lesssim \int_{\mathcal{K}} (M_{L(\log L)^\sigma} f(x))^q M^q h(x) d\mu(x).
$$

(2.36)
We first consider the case that $\mu(\mathcal{X}) = \infty$. Choose $r_1, \ldots, r_k$, $r_k$ such that $0 < q = r_0 < r_1 < \cdots < r_{k-1} < r_k < 1$. By Lemma 2.5, we obtain that for any $1 \leq m \leq k - 1$ and any weight $h$,\[
\int_{\mathcal{X}} (M^b_{r_1}(\mu_{b,m}f)(x))^q h(x) d\mu(x) \quad \leq \quad \sum_{l=0}^{m-1} \int_{\mathcal{X}} (M_{r_{l+1}}(\mu_{b,l+1}f)(x))^q h(x) d\mu(x) + \int_{\mathcal{X}} (M_{L(\log L)^q}f(x))^q h(x) d\mu(x). \tag{2.37}
\]

Therefore, applying Lemmas 2.1 and 2.2, and the estimate (2.35), we have\[
\int_{\mathcal{X}} (M_{r_{l+1}}(\mu_{b,l+1}f)(x))^q h(x) d\mu(x) = \int_{\mathcal{X}} (M((\mu_{b,l+1}f)^{r_{l+1}})(x))^{q/r_{l+1}} h(x) d\mu(x) 
\leq \int_{\mathcal{X}} (M^{q/r_{l+1}}((\mu_{b,l+1}f)^{r_{l+1}})(x))^{q/r_{l+1}} M_h(x) d\mu(x) 
\leq \int_{\mathcal{X}} (M^q((\mu_{b,l+1}f)^{r_{l+1}})(x))^{q/r_{l+1}} M_h(x) d\mu(x) 
= \int_{\mathcal{X}} (M_{r_{l+1}}(\mu_{b,l+1}f)(x))^q M_h(x) d\mu(x),
\]

which leads to\[
\int_{\mathcal{X}} (M^b_{r_1}(\mu_{b,m}f)(x))^q h(x) d\mu(x) \quad \leq \quad \sum_{l=0}^{m-1} \int_{\mathcal{X}} (M^b_{r_{l+1}}(\mu_{b,l+1}f)(x))^q M_h(x) d\mu(x) + \int_{\mathcal{X}} (M_{L(\log L)^q}f(x))^q h(x) d\mu(x). \tag{2.39}
\]

Repeating the argument above $k - 1$ times, we then have that for all weights $h$,\[
\int_{\mathcal{X}} (M^b_{r_1}(\mu_{b,m}f)(x))^q h(x) d\mu(x) \quad \leq \quad \sum_{l=0}^{k-1} \int_{\mathcal{X}} (M^b_{r_{l+1}}(\mu_{b,l+1}f)(x))^q M_h(x) d\mu(x) + \int_{\mathcal{X}} (M_{L(\log L)^q}f(x))^q h(x) d\mu(x) 
\leq \sum_{l=0}^{k-2} \int_{\mathcal{X}} (M^b_{r_{l+1}}(\mu_{b,l+1}f)(x))^q M^2 h(x) d\mu(x) + \sum_{l=0}^{k-1} \int_{\mathcal{X}} (M_{L(\log L)^q}f(x))^q M^2 h(x) d\mu(x) 
+ \int_{\mathcal{X}} (M_{L(\log L)^q}f(x))^q h(x) d\mu(x) 
\leq \sum_{l=0}^{1} \int_{\mathcal{X}} (M^b_{r_{k-1}}(\mu_{b,k-1}f)(x))^q M^{k-1} h(x) d\mu(x) + \sum_{l=0}^{k} \int_{\mathcal{X}} (M_{L(\log L)^q}f(x))^q M^{k-1} h(x) d\mu(x). \tag{2.40}
\]

On the other hand, notice that for all $x \in \mathcal{X}$, $M^b_{r_{k-1}}(\mu_{b,k-1}f)(x) \lesssim M^2 f(x)$, and that, by (2.12) and the fact that $M^2 f(x) \sim M_{L(\log L)^q}f(x)$ for all $x \in \mathcal{X}$ (see [12, (4.11)]), we then have that for all
\( x \in \mathcal{X}, M_{r_1}^\theta (\overline{M}_{b,f}(x)) \leq M_{r_1} (\overline{M}_{b,f}(x)) + M_{L(log L)} f(x) \leq M^2 f(x) \). From these inequalities, it then follows that
\[
\int_{\mathcal{X}} (M_{r_1}^\theta (\overline{M}_{b,f}(x)))^{q} h(x) d\mu(x) \\
\leq \int_{\mathcal{X}} (M^2 f(x))^{q} M^{k-1} h(x) d\mu(x) + \sum_{j=0}^{k-1} \int_{\mathcal{X}} (M_{L(log L)}^{j} f(x))^{q} M^{k-1} h(x) d\mu(x) \\
\leq \int_{\mathcal{X}} (M_{L(log L)}^{k} f(x))^{q} M^{k-1} h(x) d\mu(x),
\]
which together with (i) of Lemma 2.1 gives (2.36).

We turn our attention to (2.36) for the case of \( \mu(\mathcal{X}) < \infty \). For all \( x \in \mathcal{X} \),
\[
\overline{M}_{b,f}(x) \leq \sum_{j=0}^{k} |b(x) - m_{\mathcal{X}}(b)| M((m_{\mathcal{X}}(b) - b)^{l-j} f(x)).
\]

Moreover, the Kolmogorov inequality, together with Hölder’s inequality, the inequalities (1.22), and (2.18), tells us that for any \( 0 \leq j \leq k, r \in (0,1), \) and \( t \in (r,1), \)
\[
\frac{1}{\mu(\mathcal{X})} \int_{\mathcal{X}} |b(x) - m_{\mathcal{X}}(b)|^{r/t} (M((m_{\mathcal{X}}(b) - b)^{l-j} f(x)))^{r} d\mu(x) \\
\leq \left\{ \frac{1}{\mu(\mathcal{X})} \int_{\mathcal{X}} M((m_{\mathcal{X}}(b) - b)^{l-j} f(x))^{t} d\mu(x) \right\}^{r/t} \\
\leq \left\{ \frac{1}{\mu(\mathcal{X})} \int_{\mathcal{X}} |f(x)|^{t} d\mu(x) \right\}^{r} \lesssim (\|f\|_{L(log L)^{1+j,\mathcal{X}}})^{r}.
\]

Combining the above estimates, we obtain
\[
m_{\mathcal{X}}((\overline{M}_{b,f})^{r}) \lesssim \left( \inf_{x \in \mathcal{X}} M_{L(log L)} f(x) \right)^{r}.
\]

Let \( q, r_1, r_2, \ldots, r_k \) be as in the case of \( \mu(\mathcal{X}) = \infty \). Another application of Kolmogorov inequality and the fact that \( M \) is bounded from \( L^1(\mathcal{X}) \) to \( L^{1,\infty}(\mathcal{X}) \) leads to
\[
\left\{ m_{\mathcal{X}}(M((\overline{M}_{b,f})^{r}))^{q/r_1} \right\}^{q/r_1} \lesssim m_{\mathcal{X}}((\overline{M}_{b,f})^{r}) \lesssim \left( \inf_{x \in \mathcal{X}} M_{L(log L)} f(x) \right)^{r}.
\]

As in the case of \( \mu(\mathcal{X}) = \infty \), by Lemmas 2.1, 2.2, and 2.5, we have that for any \( q \in (0,1), \)
\[
\int_{\mathcal{X}} (\overline{M}_{b,f})^{q} h(x) d\mu(x) \leq \int_{\mathcal{X}} (M_{r_1}^\theta (\overline{M}_{b,f}(x))^{q} M h(x) d\mu(x) + h(\mathcal{X}) m_{\mathcal{X}}((\overline{M}_{b,f})^{q}) \\
\leq \sum_{j=0}^{k-1} \int_{\mathcal{X}} (M_{r_1}^\theta (\overline{M}_{b,f}(x))^{q} M^2 h(x) d\mu(x) \\
+ \int_{\mathcal{X}} (M_{L(log L)}^{k} f(x))^{q} M h(x) d\mu(x) \\
+ \sum_{j=0}^{k-1} (M h(\mathcal{X}) m_{\mathcal{X}}(M((\overline{M}_{b,f})^{r}))^{q/r_1} + h(\mathcal{X}) m_{\mathcal{X}}((\overline{M}_{b,f})^{q}) \\
\leq \int_{\mathcal{X}} (M_{L(log L)}^{k} f(x))^{q} M^4 h(x) d\mu(x).
\]

Combining the two cases yields (2.36).
We begin with some preliminary lemmas.

**Lemma 3.2.**

Then follows directly.

**Proof.**

This via

\[
\Phi_t \approx \sup_{x} \left( \int_{X} [M_{L}(\log L)^{\delta}f(x)]^{q}M_{L}(\log L)^{k\delta}w(x)d\mu(x) \right)^{q/p}
\]

where in the last inequality we have used Lemma 2.6. This completes the proof of Theorem 1.1.

\[\square\]

### 3. Proof of Theorem 1.2

We begin with some preliminary lemmas.

**Lemma 3.1** (see [17]). Let \((X,d,\mu)\) be a space of homogeneous type and let \(f\) be a nonnegative integrable function. Then for every \(\lambda > m_{X}(f)(m_{X}(f) = 0 \text{ if } \mu(X) = \infty)\), there exist a sequence of pairwise disjoint balls \(\{B_{j}\}_{j \geq 1}\) and a constant \(C_{4} \geq 1\) such that

\[
m_{C_{4}B_{j}}(f) \leq \lambda < m_{B_{j}}(f)
\]

and \(m_{B}(f) \leq \lambda\) for every ball \(B\) centered at \(x \in X \setminus (\cup_{i}C_{4}B_{i})\).

**Lemma 3.2.** Let \(d\) and \(l\) be two nonnegative integers. Then for all \(t_{1},t_{2} \geq 0,\)

\[
t_{1}t_{2}^{l} \log (e + t_{1}t_{2}^{l}) \leq C(t_{1}\log^{d+1}(e + t_{1}) + \exp t_{2}).
\]

**Proof.** We may assume that \(d \geq 1\), otherwise the conclusion holds obviously. Set \(\Phi_{1}(t) = t\log^{d+1}(e + t), \Phi_{2}(t) = t\log^{d+1}(e + t),\) and \(\Phi_{3}(t) = \exp(t^{1/d}).\) Let \(j = 1,2,3.\) Denote by \(\Phi_{j}^{-1}\) the inverse of \(\Phi_{j}\), that is, \(\Phi_{j}^{-1}(t) = \inf\{s > 0 : \Phi_{j}(s) > t\}\). It is well known that \(\Phi_{1}^{-1}(t) \approx t\log^{-1}(e + t)\) and \(\Phi_{2}^{-1}(t) \approx t\log^{-1/d}(e + t)\) (see [19]). On the other hand, it is easy to verify that \(\Phi_{3}^{-1}(t) = 0\) when \(t \in [0,1)\) and \(\Phi_{3}^{-1}(t) = \log^{d}t\) when \(t \in [1,\infty)\). Therefore, for all \(t \in [0,\infty),\)

\[
\Phi_{1}^{-1}(t_{1}t_{2}^{l}) \lesssim \Phi_{2}^{-1}(t_{1}) + \Phi_{3}^{-1}(t_{2}^{l}).
\]

This via [7, Lemma 6, page 63] tells us that \(\Phi_{1}(t_{1}t_{2}^{l}) \lesssim \Phi_{2}(t_{1}) + \Phi_{3}(t_{2}^{l}).\) Our desired conclusion then follows directly.

\[\square\]
Proof of Theorem 1.2. With the notation $\tilde{M}_{b,k}$ as in (2.7), by (2.11), it suffices to prove that for $\|b\|_{\text{BMO}(\mathcal{X})} = 1$ and all $f \in L^\infty_0(\mathcal{X})$ and $\lambda > 0$,

$$w(\{x \in \mathcal{X} : \tilde{M}_{b,k} f(x) > \lambda\}) \lesssim \int_\mathcal{X} \frac{|f(x)|}{\lambda} \log^k \left(e + \frac{|f(x)|}{\lambda}\right) M_{L(\log L)^{\infty}} w(x) d\mu(x),$$  

(3.3)

where $\tilde{k} = k$ when $k$ is even and $\tilde{k} = k + 1$ when $k$ is odd.

Recall that for all $f \in L^\infty(\mathcal{X})$,

$$w(\{x \in \mathcal{X} : \tilde{M}_f(x) > \lambda\}) \lesssim \frac{1}{\lambda} \int_\mathcal{X} |f(x)| Mw(x) d\mu(x).$$  

(3.4)

(See [18, page 151] for a proof when $\mathcal{X} = \mathbb{R}^n$. The same idea also works for $\mathcal{X}$.) By Hölder’s inequality, it follows that for all $x \in \mathcal{X}$,

$$\tilde{M}_{b,k} f(x) \leq (\tilde{M}_{b,k+1} f(x))^{k/(k+1)} (\tilde{M}_f(x))^{1/(k+1)}$$  

(3.5)

and so when $k$ is odd,

$$w(\{x \in \mathcal{X} : \tilde{M}_{b,k} f(x) > \lambda\}) \leq w(\{x \in \mathcal{X} : \tilde{M}_{b,k+1} f(x) > \lambda\}) + w(\{x \in \mathcal{X} : \tilde{M}_f(x) > \lambda\})$$
\[ \leq w(\{x \in \mathcal{X} : \tilde{M}_{b,k+1} f(x) > \lambda\}) + \frac{1}{\lambda} \int_\mathcal{X} |f(x)| Mw(x) d\mu(x). \]  

(3.6)

Thus, it suffices to prove (3.3) for the case that $k$ is even. We employ some ideas from [20], and proceed our proof of (3.3) by an inductive argument. When $k = 0$, (3.3) is implied by the fact that $Mw(x) \leq M_{L(\log L)^{1/2}} w(x)$ for all $x \in \mathcal{X}$ and (3.4). Now let $k$ be a positive integer. We may assume that $M_{L(\log L)^{k+1}} w$ is finite almost everywhere, otherwise there is nothing to be proved. For any fixed $\delta > 0$, we assume that for any nonnegative integer $l$ with $0 \leq l \leq k - 1$, there exists a constant $C = C_{l,\delta}$ such that for all $\lambda > 0$,

$$w(\{x \in \mathcal{X} : \tilde{M}_{b,l} f(x) > \lambda\}) \lesssim \int_\mathcal{X} \frac{|f(x)|}{\lambda} \log^l \left(e + \frac{|f(x)|}{\lambda}\right) M_{L(\log L)^{\infty}} w(x) d\mu(x),$$  

(3.7)

where and in what follows, $\tilde{l} = l$ when $l$ is even and $\tilde{l} = l + 1$ when $l$ is odd. If $\mu(\mathcal{X}) < \infty$ and $\lambda \leq \|f\|_{L^1(\mathcal{X})} [\mu(\mathcal{X})]^{-1}$, the inequality (3.3) is trivial. So it remains to consider the case that $\lambda > \|f\|_{L^1(\mathcal{X})} [\mu(\mathcal{X})]^{-1}$. For each fixed bounded function $f$ with bounded support and $\lambda > \|f\|_{L^1(\mathcal{X})} [\mu(\mathcal{X})]^{-1}$, applying Lemma 3.1 to $|f|$ at level $\lambda$, we obtain a sequence of balls $\{B_j\}_{j \geq 1}$ with pairwise disjoint interiors. As in the proof of Lemma 2.10 in [17], set $V_1 = (C_4 B_1) \setminus \bigcup_{n \geq 2} B_n$ and $V_j = (C_4 B_j) \setminus \bigcup_{n \geq j+1} B_j$, it then follows that $B_j \subset V_j \subset (C_4 B_j)$ and $\cup_j V_j = \cup_j (C_4 B_j)$. Define the functions $g$ and $h$, respectively, by $g \equiv \{f \chi_{\cup_j V_j} + \sum_j m_{V_j} (|f|) \chi_{V_j}\}$ and $h \equiv \sum_j h_j$ with $h_j \equiv \{(|f| - m_{V_j} (|f|)) \chi_{V_j}\}$. Recall that $\mu$ is regular and the set of continuous function is dense in $L^p(\mathcal{X})$ for any $p \in [1, \infty)$. Lemma 3.1 implies that for any fixed $j$,

$$C^{-1}_\delta \lambda \leq \frac{1}{\mu(V_j)} \int_{V_j} |f(y)| d\mu(y) \leq C_\delta \lambda$$  

(3.8)
with $C_k > 1$ a constant independent of $f$ and $j$, which together with the Lebesgue differentiation theorem and Lemma 3.1 again yields that
\[
\|g\|_{L^\infty(\mathcal{X})} \leq C_6\lambda. \tag{3.9}
\]

Let $\Omega = \bigcup_j (C_j B_j)$ with $C_j = C_1 C_4$. The doubling property of $\mu$ and (3.1) now state that
\[
w(\Omega) \lesssim \sum_j \frac{w(C_j B_j)}{\mu(C_j B_j)} \mu(B_j) \lesssim \frac{1}{\lambda} \sum_j \inf_{x \in B_j} M w(x) \int_{B_j} |f(y)| \lambda(y) \mu(y) \lesssim \frac{1}{\lambda} \int_{\mathcal{X}} |f(y)| M w(y) \mu(y). \tag{3.10}
\]

Following an argument similar to the case of Euclidean spaces (see [18, page 159]), we have that for any $\gamma \geq 0$, there exists a positive constant $C$, depending only on $\gamma$, such that for all $x \in C_4 B_j$,
\[
M_{L(\log L)^j} (w x \chi_{\Omega})(x) \lesssim \inf_{y \in C_4 B_j} M_{L(\log L)^j} (w x \chi_{\Omega})(y). \tag{3.11}
\]

Thus,
\[
|m_{V_j}(f)| \int_{V_j} M_{L(\log L)^{j+\delta}} (w x \chi_{\Omega})(x) \mu(x) \lesssim \lambda \mu(V_j) \inf_{y \in B_j} M_{L(\log L)^{j+\delta}} (w x \chi_{\Omega})(y)
\lesssim \lambda \mu(B_j) \inf_{y \in B_j} M_{L(\log L)^{j+\delta}} (w x \chi_{\Omega})(y)
\lesssim \int_{B_j} |f(x)| M_{L(\log L)^{j+\delta}} (w x \chi_{\Omega})(x) \mu(x). \tag{3.12}
\]

For each fixed $\delta > 0$, choose $p_0 \in (1, \infty)$ and $\delta_1 > 0$ such that $k p_0 + \delta_1 < k + \delta$. From the last estimate, (2.11), Theorem 1.1, and (3.9), it follows that
\[
w(\{ x \in \mathcal{X} : \tilde{M}_{k,k} g(x) > \lambda/2 \}) \lesssim \lambda^{-p_0} \int_{\mathcal{X}} |g(x)|^{p_0} M_{L(\log L)^{p_0+\delta_1}} (w x \chi_{\Omega})(x) \mu(x)
\lesssim \lambda^{-1} \int_{\mathcal{X}} |g(x)| M_{L(\log L)^{p_0+\delta_1}} (w x \chi_{\Omega})(x) \mu(x)
\lesssim \lambda^{-1} \left( \int_{\mathcal{X} \cup \bigcup_{V_j} f(x) M_{L(\log L)^{k+\delta}} (w x \chi_{\Omega})(x) \mu(x) \right)
\lesssim \lambda^{-1} \int_{\mathcal{X}} |f(x)| M_{L(\log L)^{k+\delta}} (w x \chi_{\Omega})(x) \mu(x). \tag{3.13}
\]

Thus, our proof is now reduced to proving
\[
w\left( \left\{ x \in \mathcal{X} : \tilde{M}_{k,k} h(x) > \frac{\lambda}{2} \right\} \right) \lesssim \int_{\mathcal{X}} \left[ \frac{|f(x)|}{\lambda} \log^k \left( e + \frac{|f(x)|}{\lambda} \right) M_{L(\log L)^{k+\delta}} w(x) \mu(x) \right]. \tag{3.14}
\]
where
\[
\tilde{M}_{b,k}^* h(x) = \sup_{c > 0} \left| \int_{\mathcal{X}} S_c(x, y) (b(x) - b(y))^k h(y) d\mu(y) \right|. 
\]

(3.15)

For any \( j \geq 1 \), let
\[
\tilde{M}^* h_j(x) = \sup_{c > 0} \left| \int_{\mathcal{X}} S_c(x, y) h_j(y) d\mu(y) \right|. 
\]

(3.16)

We now prove (3.14). With the aid of the formula that for all \( x, y \in \mathcal{X} \),
\[
(b(x) - b(y))^k = \sum_{l=0}^{k} l! \left( m_{B_j}(b) - b(y) \right)^{k-l},
\]

since \( k \) is even, for \( x \in \mathcal{X} \setminus \Omega \), we write
\[
\tilde{M}_{b,k}^* h(x) \lesssim \sum_{l=0}^{k-1} \left| b(x) - m_{B_j}(b) \right|^l \tilde{M}^* h_j(x) + \sum_{l=0}^{k-1} \sum_{j} \left( m_{B_j}(b) - b(y) \right)^{k-l} \right)_{(x)}
\]

(3.17)

Recall that \( \{V_j\}_{j} \) are mutually disjoint. If we set \( \Phi_t(t) = \log^{'}(e + t) \), our inductive hypothesis (3.7) via (3.11) now tells us that
\[
\log \left( \sum_{j} \Phi_t \left( \frac{|b(y) - m_{B_j}(b)|^{k-l}|f(y)|}{\lambda} \right) d\mu(y) \right) \inf_{x \in \mathcal{X}} M_{L(\log L)^{j-\delta}} (w^{\chi \setminus \Omega}(z)) \]

(3.18)

An application of Lemma 3.2 then gives that
\[
\int_{V_j} \Phi_t \left( \frac{|b(y) - m_{B_j}(b)|^{k-l}|f(y)|}{\lambda} \right) d\mu(y) \lesssim \int_{V_j} \Phi_t \left( \frac{|b(y) - m_{B_j}(b)|^{k-l}|f(y)|}{\lambda} \right) d\mu(y) + \Phi_t \left( |m_{B_j}(b) - m_{B_j}(b)|^{k-l} \right) \int_{V_j} \Phi_t \left( \frac{|f(y)|}{\lambda} \right) d\mu(y)
\]

(3.19)

\[
\lesssim \int_{V_j} \exp \left( \frac{|b(y) - m_{B_j}(b)|}{C_2} \right) d\mu(x) + \int_{V_j} \Phi_k \left( \frac{|f(x)|}{\lambda} \right) d\mu(x) \lesssim \int_{V_j} \Phi_k \left( \frac{|f(x)|}{\lambda} \right) d\mu(x).
\]

(3.20)
For each fixed $j$, notice that by (3.8) and Lemma 3.2,

$$\int_{V_j} \Phi_l \left( \frac{|b(y) - m_{B_j}(b)|^{k-l} |m_{V_j}(f)|}{1} \right) d\mu(y) \lesssim \mu(B_j).$$ \hfill (3.21)

It then follows that

$$w \left( \left\{ x \in \mathcal{X} \setminus \Omega : H(x) > \frac{1}{4} \right\} \right) \lesssim \sum_j \int_{V_j} \Phi_k \left( \frac{|f(x)|}{\lambda} \right) M_{L/(\log L)^\delta} w(x) d\mu(x)$$

$$+ \sum_j \mu(B_j) \inf_{y \in B_j} M_{L/(\log L)^\delta} w(y)$$

$$\lesssim \int_{\mathcal{X}} \Phi_k \left( \frac{|f(x)|}{\lambda} \right) M_{L/(\log L)^\delta} w(x) d\mu(x).$$ \hfill (3.22)

It remains to prove that

$$w \left( \left\{ x \in \mathcal{X} \setminus \Omega : G(x) > \frac{1}{4} \right\} \right) \lesssim \lambda^{-1} \int_{\mathcal{X}} |f(x)| M_{L/(\log L)^\delta} w(x) d\mu(x).$$ \hfill (3.23)

For each fixed $j$, let $y_j$ and $r_j$ be the center and radius of $B_j$, respectively. If $x \in \mathcal{X} \setminus \Omega$, then by the vanishing moment of $h_j$ and the estimate (2.14), we obtain that

$$\overline{M}^* h_j(x) \leq \sup_{c > 0} \int_{\mathcal{X}} \left| S_c(x, y_j) - S_c(x, y_j) \right| |h_j(y)| d\mu(y)$$

$$\lesssim (r_j)^{\gamma} \frac{|d(x, y_j)|^{-\gamma}}{\mu(B(y_j, d(x, y_j)))} \int_{\mathcal{X}} |h_j(y)| d\mu(y).$$ \hfill (3.24)

This in turn implies that

$$w \left( \left\{ x \in \mathcal{X} \setminus \Omega : G(x) > \frac{1}{4} \right\} \right)$$

$$\lesssim \frac{1}{\lambda} \sum_j (r_j)^{\gamma} \int_{\mathcal{X} \setminus C_{\lambda} B_j} \frac{|b(x) - m_{B_j}(b)|^k}{\mu(B(y_j, d(x, y_j)))} \left| \frac{w(x)}{d(x, y_j)} \right| \int_{\mathcal{X}} |h_j(y)| d\mu(y)$$

$$\lesssim \frac{1}{\lambda} \sum_j (r_j)^{\gamma} \int_{\mathcal{X} \setminus C_{\lambda} B_j} \frac{|b(x) - m_{B_j}(b)|^k}{\mu(B(y_j, d(x, y_j)))} \left( \frac{w(x)}{d(x, y_j)} \right)^{\gamma} \int_{\mathcal{X}} |h_j(y)| d\mu(y)$$

$$\lesssim \frac{1}{\lambda} \sum_j \int_{\mathcal{X}} \left| h_j(y) \right| d\mu(y) \inf_{y \in C_{\lambda} B_j} M_{L/(\log L)^\delta} \sup_{y \in C_{\lambda} B_j} w(y)$$

$$\lesssim \frac{1}{\lambda} \int_{\mathcal{X}} |f(x)| M_{L/(\log L)^\delta} w(x) d\mu(x),$$ \hfill (3.25)

where in the second to the last inequality, we use the fact that for each fixed $j$, $y_j \in V_j$ and positive integer $l$, a standard argument involving the inequalities (1.22) and (2.18).
Proof of Theorem 1.3.

≡ proof of Theorem 1.2 in Lemma 4.1, it is obvious that and we will only give an outline. Also, we proceed our proof by an inductive argument. By where yields see also the proof of (2.25). We then complete the proof of Theorem 1.2. □

4. Proof of Theorem 1.3

This section is devoted to the proof of Theorem 1.3.

Lemma 4.1. Let \( T \) be a Calderón-Zygmund operator. Then, there exists a positive constant \( C \) such that for all \( \lambda > 0 \), \( f \in L^\infty_b(\mathcal{X}) \), and weights \( w \),

\[
\int_{\{x \in X : T^* f(x) > \lambda\}} w(x) d\mu(x) \leq C \int_X \frac{|f(x)|}{\lambda} M_{L(\log L)^{i+1}} w(x) d\mu(x). \tag{4.1}
\]

Lemma 4.1 can be proved by a similar but more careful argument as that used in the proof of Theorem 1.2 in [8]. We omit the proof here for brevity.

Proof of Theorem 1.3. The argument here is similar to that used in the proof of Theorem 1.2, and we will only give an outline. Also, we proceed our proof by an inductive argument. By Lemma 4.1, it is obvious that (1.19) is true when \( k = 0 \). Now let \( k \) be a positive integer. For any fixed \( \delta > 0 \), and any nonnegative integer \( l \) with \( 0 \leq l \leq k - 1 \), we assume that for all \( \lambda > 0 \) and \( f \in L^\infty_b(\mathcal{X}) \),

\[
\int_{\{x \in X : T^* f(x) > \lambda\}} w(x) d\mu(x) \leq \int_X \frac{|f(x)|}{\lambda} \log \left( e + \frac{|f(x)|}{\lambda} \right) M_{L(\log L)^{i+1}} w(x) d\mu(x). \tag{4.2}
\]

We need only consider the case that \( \lambda > \|f\|_{L^1(\mathcal{X})} [\mu(\mathcal{X})]^{-1} \). For each fixed bounded function \( f \) with bounded support and \( \lambda > \|f\|_{L^1(\mathcal{X})} [\mu(\mathcal{X})]^{-1} \), applying Lemma 3.1 to \( f \) at level \( \lambda \), with the same notation \( \{B_j\}_\lambda, \{V_j\}_\lambda, \Omega \) as in the proof of Theorem 1.2, we decompose \( f = g + h \), where \( g = f 1_{X \setminus \Omega} + \sum m V_j(f) 1_{V_j} \) and \( h = \sum h_j \) with \( h_j \) with \( \lambda \rangle (f - m V_j(f)) 1_{V_j} \). Applying the estimate (1.17), and a similar argument to that used to deal with the term \( \hat{M}_{b,k} g \) gives us that

\[
w(\left\{ x \in (X \setminus \Omega) : T^*_{b,k} g(x) > \frac{1}{2} \right\}) \leq \lambda^{-p_0} \int_X |g(x)|^{p_0} M_{L(\log L)^{i+1+p_0+\delta}} (w 1_{X \setminus \Omega})(x) d\mu(x)
\]

\[
\leq \lambda^{-1} \int_X |f(x)| M_{L(\log L)^{i+1}} w(x) d\mu(x), \tag{4.3}
\]

where \( p_0 \in (1, \infty) \) and \( \delta > 0 \) such that \( (k + 1)p_0 + \delta < k + 1 + \delta_0 \).

We now turn to the term \( T^*_{b,k} h \). For any \( x \in X \setminus \Omega \) and \( \epsilon > 0 \), set

\[
I_1(x, \epsilon) = \{ j : \forall y \in C_4 B_j, d(x, y) \leq \epsilon \}, \\
I_2(x, \epsilon) = \{ j : \forall y \in C_4 B_j, d(x, y) > \epsilon \}, \\
I_3(x, \epsilon) = \{ j : (C_4 B_j) \cap \{ y \in X : d(x, y) > \epsilon \} \neq \emptyset, (C_4 B_j) \cap \{ y \in X : d(x, y) \leq \epsilon \} \neq \emptyset \}. \tag{4.4}
\]
It then follows that
\[
|T_{c,h,k}h(x)| \leq |T_{c,h,k} \left( \sum_{j \in I_2(x,e)} h_j \right)(x) + \left| T_{c,h,k} \left( \sum_{j \in I_3(x,e)} h_j \right)(x) \right|
\]
\[
\lesssim \left| \sum_{j \in I_2(x,e)} (b(x) - m_{B_j}(b))^k T_{c,h_j}(x) \right| + \left| \sum_{j \in I_3(x,e)} (b(x) - m_{B_j}(b))^k h_j(x) \right|
\]
\[
+ \sum_{l=0}^{k-1} \left| T_{c,h,k} \left( \sum_{j \in I_3(x,e)} (b(x) - m_{B_j}(b))^{k-l} h_j \right)(x) \right|
\]
\[
+ \left| T_{c,h,k} \left( \sum_{j \in I_3(x,e)} h_j \right)(x) \right| = U_e(x) + V_e(x) + W_e(x) + X_e(x).
\]

Notice that for \( x \in (\mathcal{X} \setminus \Omega) \) and \( j \in I_2(x,e) \), we have that \( T_{e,h_j}(x) = Th_j(x) \). By the vanishing moment of \( h_j \) and the regularity condition (1.13), we have
\[
\sup_{e > 0} U_e(x) \leq \sum_j |b(x) - m_{B_j}(b)|^k \int_{\mathcal{X}} \frac{(d(y, y_j))^7}{\mu(B(y, d(x, y)))(d(x, y))} |h_j(y)| d\mu(y)
\]
and so
\[
\omega \left( \left\{ x \in (\mathcal{X} \setminus \Omega) : \sup_{e > 0} U_e(x) > \frac{1}{6} \right\} \right)
\]
\[
\lesssim 1^{-1} \sum_j \int_{\mathcal{X}} |h_j(y)| (d(y, y_j))^7 \int_{\mathcal{X} \setminus C, B_j} \frac{|b(x) - m_{B_j}(b)|^k \omega(x)}{\mu(B(y, d(x, y)))(d(x, y))} d\mu(x) d\mu(y)
\]
\[
\lesssim 1^{-1} \int_{\mathcal{X}} |f(x)| M_{L, \log L, L} \omega(x) d\mu(x).
\]

Our inductive hypothesis (4.2), via the argument for the term \( H \) in the proof of Theorem 1.2, leads to
\[
\omega \left( \left\{ x \in (\mathcal{X} \setminus \Omega) : \sup_{e > 0} V_e(x) > \frac{1}{4} \right\} \right) \lesssim \int_{\mathcal{X}} \frac{|f(x)|}{\lambda} \log^k \left( e + \frac{|f(x)|}{\lambda} \right) M_{L, \log L, L} \omega(x) d\mu(x).
\]

Notice that for \( x \in (\mathcal{X} \setminus \Omega) \) and \( j \in I_3(x,e) \), we have that \( C_8 B_j \subset \{ B(x, C_8 e) \setminus B(x, C_9 e) \} \), where \( C_8 \) and \( C_9 \) with \( C_8 > C_9 \) are two positive constants. Therefore, for all \( x \in (\mathcal{X} \setminus \Omega) \),
\[
\sup_{e > 0} (W_e(x) + X_e(x)) \lesssim \sum_{l=0}^{k} M_{b,l} \left( \sum_{j} |b - m_{B_j}(b)|^{k-l} |h_j| \right)(x).
\]

This, along with Theorem 1.2 and an argument for the term \( H \) in the proof of Theorem 1.2, leads to
\[
\omega \left( \left\{ x \in (\mathcal{X} \setminus \Omega) : \sup_{e > 0} (W_e(x) + X_e(x)) > \frac{1}{6} \right\} \right)
\]
\[
\lesssim \sum_{l=0}^{k} \sum_{j} \int_{V_l} \Phi \left( \frac{|b(y) - m_{B_j}(y)|^{k-l} |h_j(y)|}{\lambda} \right) M_{L, \log L, L} \omega(x \setminus \Omega)(y) d\mu(y)
\]
\[
\lesssim \int_{\mathcal{X}} \frac{|f(y)|}{\lambda} \log^k \left( e + \frac{|f(y)|}{\lambda} \right) M_{L, \log L, L} \omega(y) d\mu(y),
\]

Notice that for \( x \in (\mathcal{X} \setminus \Omega) \) and \( j \in I_3(x,e) \), we have that \( C_8 B_j \subset \{ B(x, C_8 e) \setminus B(x, C_9 e) \} \), where \( C_8 \) and \( C_9 \) with \( C_8 > C_9 \) are two positive constants. Therefore, for all \( x \in (\mathcal{X} \setminus \Omega) \),
\[
\sup_{e > 0} (W_e(x) + X_e(x)) \lesssim \sum_{l=0}^{k} M_{b,l} \left( \sum_{j} |b - m_{B_j}(b)|^{k-l} |h_j| \right)(x).
\]

This, along with Theorem 1.2 and an argument for the term \( H \) in the proof of Theorem 1.2, leads to
\[
\omega \left( \left\{ x \in (\mathcal{X} \setminus \Omega) : \sup_{e > 0} (W_e(x) + X_e(x)) > \frac{1}{6} \right\} \right)
\]
\[
\lesssim \sum_{l=0}^{k} \sum_{j} \int_{V_l} \Phi \left( \frac{|b(y) - m_{B_j}(y)|^{k-l} |h_j(y)|}{\lambda} \right) M_{L, \log L, L} \omega(x \setminus \Omega)(y) d\mu(y)
\]
\[
\lesssim \int_{\mathcal{X}} \frac{|f(y)|}{\lambda} \log^k \left( e + \frac{|f(y)|}{\lambda} \right) M_{L, \log L, L} \omega(y) d\mu(y),
\]
which completes the proof of Theorem 1.3.

\[ w \left( \left\{ x \in (\mathcal{X} \setminus \Omega) : T_{b,k}^* h(x) > \frac{\lambda}{2} \right\} \right) \lesssim \int_{\mathcal{X}} \frac{|f(y)|}{\lambda} \log \left( e + \frac{|f(y)|}{\lambda} \right) M_{L_\infty \log L_\infty}(\omega) \delta w(y) \, d\mu(y), \]

(4.11)

which completes the proof of Theorem 1.3.
