Considered here is the first initial boundary value problem for a semilinear degenerate parabolic equation involving the Grushin operator in a bounded domain $\Omega$. We prove the regularity and exponential growth of a pullback attractor in the space $S^s_\Omega(\Omega) \cap L^{3p-2}(\Omega)$ for the nonautonomous dynamical system associated to the problem. The obtained results seem to be optimal and, in particular, improve and extend some recent results on pullback attractors for reaction-diffusion equations in bounded domains.

1. Introduction

Let $\Omega$ be a bounded domain in $\mathbb{R}^{N_1} \times \mathbb{R}^{N_2}$ ($N_1, N_2 \geq 1$), with smooth boundary $\partial \Omega$. In this paper, we consider the following problem:

\[
\begin{align*}
  u_t - G_s u + f(u) &= g(t, x), \quad (t, x) \in Q_{\tau,T} = (\tau,T] \times \Omega, \\
  u(x, t) &= 0, \quad x \in \partial \Omega, \ t \in (\tau,T], \\
  u(x, \tau) &= u_\tau(x), \quad x \in \Omega,
\end{align*}
\]

where

\[
G_s u = \Delta_{x_1} u + |x_1|^{2s} \Delta_{x_2} u, \quad x = (x_1, x_2) \in \Omega \subset \mathbb{R}^{N_1} \times \mathbb{R}^{N_2}, \ s \geq 0,
\]
is the Grushin operator, \( u_r \in L^2(\Omega) \) is given, the nonlinearity \( f \) and the external force \( g \) satisfy the following conditions.

\[(H1) \text{ The nonlinearity } f \in C^1(\mathbb{R}, \mathbb{R}) \text{ satisfies}
\]

\[
f(u) u \geq C_1 |u|^p - C_2, \quad p \geq 2, \tag{1.3}
\]

\[
|f'(u)| \leq C_3 |u|^{p-2} + C_4, \tag{1.4}
\]

\[
f'(u) \geq -\ell, \tag{1.5}
\]

where \( \ell, C_i (i = 1, 2, 3, 4) \) are positive constants. Relation (1.3) and (1.4) imply that

\[
\alpha_1 |u|^p - \alpha_2 \leq F(u) \leq \alpha_3 |u|^p + \alpha_4, \tag{1.6}
\]

where \( F(s) = \int_0^s f(\tau) d\tau \), and \( \alpha_i (i = 1, 2, 3, 4) \) are positive constants.

\[(H2) \text{ } g \in W^{1,2}_{\text{loc}}(\mathbb{R} ; L^2(\Omega)) \text{ satisfies}
\]

\[
\int_{-\infty}^t e^{\lambda_1 s} \left( \|g(s)\|_{L^2(\Omega)}^2 \right) \, ds < +\infty, \quad \forall t \in \mathbb{R}, \tag{1.7}
\]

where \( \lambda_1 \) is the first eigenvalue of the operator \(-G_s\) in \( \Omega \) with the homogeneous Dirichlet boundary condition.

The Grushin operator \( G_s \) was first introduced in [1]. Noting that if \( s > 0 \), then \( G_s \) is not elliptic in domains of \( \mathbb{R}^N \times \mathbb{R}^N \) which intersect the hyperplane \( \{x_1 = 0\} \). In the last few years, the existence and long-time behavior of solutions to parabolic equations involving the Grushin operator have been studied widely in both autonomous and nonautonomous cases (see, e.g., [2–7]). In particular, the existence of a pullback attractor in \( S^1_0(\Omega) \cap L^p(\Omega) \) for the process associated to problem (1.1) is considered in [2].

In this paper we continue the study in the paper [2]. First, we will prove the existence of pullback attractors in \( S^1_0(\Omega) \) (see Section 2 for its definition) and \( L^{2p-2}(\Omega) \). As we know, if the external force \( g \) is only in \( L^2(\Omega) \), then solutions of problem (1.1) are at most in \( L^{2p-2}(\Omega) \cap S^1_0(\Omega) \) and have no higher regularity. Therefore, there are no compact embedding results that hold for this case. To overcome the difficulty caused by the lack of embedding results, we exploit the asymptotic a priori estimate method which was initiated in [8, 9] for autonomous equations and developed recently for nonautonomous equations in the case of pullback attractors in [10]. Noting that, to prove the existence of pullback attractors in \( S^1_0(\Omega) \cap L^p(\Omega) \), we only need assumption (H2) of the external force \( g \); however, to prove the existence of pullback attractors in \( S^1_0(\Omega) \) and \( L^{2p-2}(\Omega) \), we need an additional assumption of \( g \), namely, (3.18) in Section 3. Next, following the general lines of the approach in [11], we give exponential growth conditions in \( S^1_0(\Omega) \cap L^{2p-2}(\Omega) \) for the pullback attractors. It is noticed that, as far as we know, the best known results on the pullback attractors for nonautonomous reaction-diffusion equations are the boundedness and exponential growth in \( H^2(\Omega) \) of the pullback attractors [11, 12]. Therefore, the obtained results seem to be optimal and, in particular when \( s = 0 \), improve the recent results on pullback attractors for the nonautonomous reaction-diffusion equations in [11–15].
The content of the paper is as follows. In Section 2, for the convenience of the reader, we recall some concepts and results on function spaces and pullback attractors which we will use. In Section 3, we prove the existence of pullback attractors in the spaces \( S_0^2(\Omega) \) and \( L^{2p-2}(\Omega) \) by using the asymptotic a priori estimate method. In Section 4, under additional assumptions of \( g \), an exponential growth in \( S_0^2(\Omega) \cap L^{2p-2}(\Omega) \) for the pullback attractors is deduced.

2. Preliminaries

2.1. Operator and Function Spaces

In order to study the boundary value problem for equations involving the Grushin operator, we have usually used the natural energy space \( S_0^1(\Omega) \) defined as the completion of \( C_0^\infty(\Omega) \) in the following norm:

\[
\| u \|_{S_0^1(\Omega)} = \left( \int_\Omega \left( |\nabla_x u|^2 + |x_1|^2 |\nabla_y u|^2 \right) dx \right)^{1/2}
\]

(2.1)

and the scalar product

\[
( (u, v) ) = \left( \int_\Omega \left( \nabla_x u \nabla_x v + |x_1|^2 \nabla_y u \nabla_y v \right) dx \right)^{1/2}.
\]

(2.2)

The following lemma comes from [16].

Lemma 2.1. Assume that \( \Omega \) is a bounded domain in \( \mathbb{R}^{N_1} \times \mathbb{R}^{N_2} \) \((N_1, N_2 \geq 0)\). Then the following embeddings hold:

(i) \( S_0^1(\Omega) \hookrightarrow L^{2^*_s}(\Omega) \) continuously;

(ii) \( S_0^1(\Omega) \hookrightarrow L^p(\Omega) \) compactly if \( p \in [1, 2^*_s) \),

where \( 2^*_s = 2N(s) / (N(s) - 2) \), \( N(s) = N_1 + (s + 1)N_2 \).

Now, we introduce the space \( S_0^2(\Omega) \) defined as the closure of \( C_0^\infty(\Omega) \) with the norm

\[
\| u \|_{S_0^2(\Omega)} = \left( \int_\Omega \left( |\Delta_x u|^2 + |x_1|^2 |\Delta_y u|^2 \right) dx \right)^{1/2} = \left( \int_\Omega |G_s u|^2 dx \right)^{1/2}.
\]

(2.3)

The following lemma comes directly from the definitions of \( S_0^1(\Omega) \) and \( S_0^2(\Omega) \).

Lemma 2.2. Assume that \( \Omega \) is a bounded domain in \( \mathbb{R}^{N_1} \times \mathbb{R}^{N_2} \) \((N_1, N_2 \geq 0)\), with smooth boundary \( \partial \Omega \). Then \( S_0^2(\Omega) \subset S_0^1(\Omega) \) continuously.

It is known that (see, e.g., [3]) for the operator \( A = -G_s \), there exist \( \{ e_j \}_{j \geq 1} \)
such that

\[(e_j, e_k) = \delta_{jk}, \quad Ae_j = \lambda_j e_j, \quad j, k = 1, 2, \ldots, \]

\[0 < \lambda_1 \leq \lambda_2 \leq \lambda_3 \leq \cdots, \quad \lambda_j \to +\infty \text{ as } j \to \infty, \tag{2.4}\]

and \(\{e_j\}^j_{j=1}\) is a complete orthonormal system in \(L^2(\Omega)\).

### 2.2. Pullback Attractors

Let \(X\) be a Banach space with the norm \(\|\cdot\|\). \(B(X)\) denotes all bounded sets of \(X\). The Hausdorff semidistance between \(A\) and \(B\) is defined by

\[\text{dist}(A, B) = \sup_{x \in A} \inf_{y \in B} \|x - y\|. \tag{2.5}\]

Let \(\{U(t, \tau) : t \geq \tau, \tau \in \mathbb{R}\}\) be a process in \(X\), that is, \(U(t, \tau) : X \to X\) such that \(U(\tau, \tau) = Id\) and \(U(t, s)U(s, \tau) = U(t, \tau)\) for all \(t \geq s \geq \tau, \tau \in \mathbb{R}\). The process \(\{U(t, \tau)\}\) is said to be norm-to-weak continuous if \(U(t, \tau)x_n \to U(t, \tau)x, \text{ as } x_n \to x \text{ in } X, \text{ for all } t \geq \tau, \tau \in \mathbb{R}\). The following result is useful for proving the norm-to-weak continuity of a process.

**Proposition 2.3** (see [9]). Let \(X, Y\) be two Banach spaces, and let \(X^*, Y^*\) be, respectively, their dual spaces. Suppose that \(X\) is dense in \(Y\), the injection \(i : X \to Y\) is continuous, and its adjoint \(i^* : Y^* \to X^*\) is dense, and \(\{U(t, \tau)\}\) is a continuous or weak continuous process on \(Y\). Then \(\{U(t, \tau)\}\) is norm-to-weak continuous on \(X\) if and only if for \(t \geq \tau, \tau \in \mathbb{R}\), \(U(t, \tau)\) maps compact sets of \(X\) into bounded sets of \(X\).

**Definition 2.4.** The process \(\{U(t, \tau)\}\) is said to be pullback asymptotically compact if for any \(t \in \mathbb{R}\), any \(D \in B(X)\), any sequence \(\tau_n \to -\infty\), and any sequence \(\{x_n\} \subset D\), the sequence \(\{U(t, \tau_n)x_n\}\) is relatively compact in \(X\).

**Definition 2.5.** A family of bounded sets \(\mathcal{B} = \{B(t) : t \in \mathbb{R}\}\subset X\) is called a pullback absorbing set for the process \(\{U(t, \tau)\}\) if for any \(t \in \mathbb{R}\) and any \(D \in B(X)\), there exist \(\tau_0 = \tau_0(D, t) \leq t\) and \(B(t) \in \mathcal{B}\) such that

\[\bigcup_{\tau \leq \tau_0} U(t, \tau)D \subset B(t). \tag{2.6}\]

**Definition 2.6.** The family \(\mathcal{A} = \{A(t) : t \in \mathbb{R}\} \subset B(X)\) is said to be a pullback attractor for \(\{U(t, \tau)\}\) if

1. \(A(t)\) is compact for all \(t \in \mathbb{R}\),
2. \(\mathcal{A}\) is invariant, that is,

\[U(t, \tau)A(\tau) = A(t), \quad \forall t \geq \tau, \tag{2.7}\]
Abstract and Applied Analysis

(3) $\mathcal{A}$ is pullback attracting, that is,

$$\lim_{\tau \to -\infty} \text{dist}(U(t, \tau)D, A(t)) = 0, \quad \forall D \in \mathcal{B}(X), \quad \text{and all } t \in \mathbb{R},$$

(2.8)

(4) if $\{C(t) : t \in \mathbb{R}\}$ is another family of closed pullback attracting sets, then $A(t) \subset C(t)$, for all $t \in \mathbb{R}$.

**Theorem 2.7** (see [13]). Let $\{U(t, \tau)\}$ be a norm-to-weak continuous process which is pullback asymptotically compact. If there exists a pullback absorbing set $B = \{B(t) : t \in \mathbb{R}\}$, then $\{U(t, \tau)\}$ has a unique pullback attractor $\mathcal{A} = \{A(t) : t \in \mathbb{R}\}$ and

$$A(t) = \bigcap_{s \leq t} \bigcup_{\tau \leq s} U(t, \tau)B(\tau).$$

(2.9)

In the rest of the paper, we denote by $| \cdot |_2$, $(\cdot, \cdot)$ the norm and inner product in $L^2(\Omega)$, respectively, and by $| \cdot |_p$ the norm in $L^p(\Omega)$. By $\| \cdot \|$ we denote the norm in $S^1_0(\Omega)$. For a Banach space $E$, $\| \cdot \|_E$ will be the norm. We also denote by $C$ an arbitrary constant, which is different from line to line, and even in the same line.

**3. Existence of Pullback Attractors in $S^2_0(\Omega) \cap L^{2p-2}(\Omega)$**

It is well known (see, e.g., [2] or [14]) that under conditions (H1) – (H2), problem (1.1) defines a process

$$U(t, \tau) : L^2(\Omega) \to S^1_0(\Omega) \cap L^p(\Omega), \quad \forall t \geq \tau,$$

(3.1)

where $U(t, \tau)u_\tau$ is the unique weak solution of (1.1) with initial datum $u_\tau$ at time $\tau$. The process $\{U(t, \tau)\}$ has a pullback attractor in $S^1_0(\Omega) \cap L^p(\Omega)$.

In this section, we will prove that the pullback attractor is in fact in $S^2_0(\Omega) \cap L^{2p-2}(\Omega)$.

**Lemma 3.1.** Assuming that $f$ and $g$ satisfy (H1)-(H2), $u(t)$ is a weak solution of (1.1). Then the following inequality holds for $t > \tau$:

$$\|u\|^2 + |u_t|^p \leq C \left( e^{-\lambda_1(t-\tau)}|u_\tau|_2^2 + 1 + e^{-\lambda_1 t} \int_{-\infty}^{t} e^{\lambda_1 s} |g(s)|_2^2 ds \right),$$

(3.2)

where $C$ is a positive constant.

**Proof.** Multiplying (1.1) by $u$ and then integrating over $\Omega$, we get

$$\frac{1}{2} \frac{d}{dt} |u|_2^2 + |u_t|^2 + \int_{\Omega} f(u)u dx = \int_{\Omega} g(t)u dx \leq \frac{1}{\lambda_1} |g(t)|_2^2 + \frac{\lambda_1}{4} |u|_2^2.$$  

(3.3)
Using hypothesis (H1) and the inequality $\|u\|^2 \geq \lambda_1 |u|^2_2$, we have

$$
\frac{d}{dt} |u|^2_2 + \lambda_1 |u|^2_2 + C\left( \|u\|^2 + |u|^p_2 \right) \leq C\left( 1 + |g(t)|^2_2 \right).
$$

(3.4)

Letting $F(s) = \int_0^s f(\tau) d\tau$, by (H1), we have

$$
\alpha_1 |u|^p_2 - \alpha_2 \leq F(u) \leq \alpha_3 |u|^p_2 + \alpha_4.
$$

(3.5)

Now multiplying (3.4) by $e^{\lambda t}$ and using (3.5), we get

$$
\frac{d}{dt} \left( e^{\lambda t} |u(t)|^2_2 \right) + Ce^{\lambda t} \left( \|u\|^2 + 2 \int_\Omega F(u(t)) dx \right) \leq Ce^{\lambda t} \left( 1 + |g(t)|^2_2 \right).
$$

(3.6)

Integrating (3.6) from $\tau$ to $s \in [\tau, t - 1]$ and $s$ to $s + 1$, respectively, we obtain

$$
e^{\lambda s}|u(s)|^2_2 \leq e^{\lambda \tau}|u|^2_2 + Ce^{\lambda s} + C \int_\tau^s e^{\lambda r} |g(r)|^2_2 dr, \quad \forall s \in [\tau, t - 1],
$$

(3.7)

\[ C \int_s^{s+1} e^{\lambda r} \left( \|u(r)\|^2 + 2 \int_\Omega F(u(x, r)) dx \right) dr \leq e^{\lambda s}|u|^2_2 + C \int_\tau^s e^{\lambda r} \left( 1 + |g(r)|^2_2 \right) dr \]

\[ \leq e^{\lambda \tau}|u|^2_2 + Ce^{\lambda s} + C \int_\tau^s e^{\lambda r} |g(r)|^2_2 dr \]

\[ + Ce^{\lambda (s+1)} + C \int_s^{s+1} e^{\lambda r} |g(r)|^2_2 dr \]

\[ \leq C \left( e^{\lambda \tau}|u|^2_2 + e^{\lambda s} + \int_\tau^s e^{\lambda r} |g(r)|^2_2 dr \right). \]

(3.8)

Multiplying (1.1) by $u_t$ and integrating over $\Omega$, we have

$$
|u_t(s)|^2_2 + \frac{1}{2} \frac{d}{ds} \left( \|u(s)\|^2 + 2 \int_\Omega F(u(x, s)) dx \right) = \int_\Omega g(s) u_t(s) \leq \frac{1}{2} |g(s)|^2_2 + \frac{1}{2} |u_t(s)|^2_2.
$$

(3.9)

Thus

$$
e^{\lambda s}|u_t(s)|^2_2 + \frac{d}{ds} \left[ e^{\lambda s} \left( \|u(s)\|^2 + 2 \int_\Omega F(u(x, s)) dx \right) \right] \leq \lambda_1 e^{\lambda s} \left( \|u(s)\|^2 + 2 \int_\Omega F(u(x, s)) dx \right) + e^{\lambda s} |g(s)|^2_2.
$$

(3.10)
Combining (3.8) and (3.10), and using the uniform Gronwall inequality, we have

\[
e^{\lambda_1t}\left(\|u(t)\|^2 + 2\int_\Omega F(u(x,t))dx\right) \leq C \left(e^{\lambda_1\tau}\|u_\tau\|^2 + e^{\lambda_1t} + \int_{-\infty}^{t} e^{\lambda_1\tau}|g(s)|^2_2 ds\right). \tag{3.11}
\]

Using (H1) once again and thanks to \(e^{\lambda_1\tau}\|u_\tau\|^2 \to 0\) as \(\tau \to -\infty\), we get the desired result from (3.11).

**Lemma 3.2.** Assume that (H1), (H 2) hold. Then for any \(t \in \mathbb{R}\) and any \(D \subset L^2(\Omega)\) that is bounded, there exists \(\tau_0 \leq t - 1\) such that

\[
|u_t(t)|_2^2 \leq C \left(1 + e^{-\lambda_1t} \int_{-\infty}^{t} e^{\lambda_1\tau}\left(\|g(s)\|^2_2 + |g'(s)|^2_2\right) ds\right), \tag{3.12}
\]

for any \(\tau \leq \tau_0\) and any \(u_\tau \in D\), where \(u_\tau(s) = (d/dt)(U(t,\tau)u_\tau)|_{t=s}\).

**Proof.** Integrating (3.10) from \(r\) to \(r + 1\), \(r \in [\tau, t-1]\) and using (3.8) and (3.11), in particular we find

\[
\int_{r}^{r+1} e^{\lambda_1s}\|u_t\|^2_2 ds \leq e^{\lambda_1r}\left(\|u(r)\|^2 + 2\int_\Omega F(u(x,r))dx\right)
+ \lambda_1 \int_{r}^{r+1} e^{\lambda_1s}\left(\|u(s)\|^2 + 2\int_\Omega F(u(x,s))dx\right) ds \tag{3.13}
+ \int_{r}^{r+1} e^{\lambda_1s}|g(s)|^2_2 ds \leq C \left(e^{\lambda_1\tau}\|u_\tau\|^2 + e^{\lambda_1t} + \int_{-\infty}^{t} e^{\lambda_1s}|g(s)|^2_2 ds\right).
\]

On the other hand, differentiating (1.1) and denoting \(v = u_t\), we have

\[
v_t - G_s v + f'(u)v = g'(t). \tag{3.14}
\]

Taking the inner product of (3.14) with \(v\) in \(L^2(\Omega)\), we get

\[
\frac{1}{2} \frac{d}{dt} |v|^2_2 + \|v\|^2 + (f'(u)v, v) = (g'(t), v). \tag{3.15}
\]

Using (1.5) and Young’s inequality, after a few computations, we see that

\[
\frac{d}{dt} \left(e^{\lambda_1t}|v|^2_2 + 2e^{\lambda_1t}\|v\|^2\right) \leq Ce^{\lambda_1t}|v|^2_2 + C e^{\lambda_1t}|g'(t)|^2_2. \tag{3.16}
\]

Combining (3.16) and (3.13) and using the uniform Gronwall inequality, we obtain

\[
e^{\lambda_1t}|v(t)|_2^2 \leq C \left(e^{\lambda_1\tau}\|u_\tau\|^2 + e^{\lambda_1t} + \int_{-\infty}^{t} e^{\lambda_1\tau}\left(\|g(s)\|^2_2 + |g'(s)|^2_2\right) ds\right). \tag{3.17}
\]

The proof is now complete because \(e^{\lambda_1\tau}\|u_\tau\|^2 \to 0\) as \(\tau \to -\infty\).
3.1. Existence of a Pullback Attractor in $L^{2p-2}(\Omega)$

In this section, following the general lines of the method introduced in [9], we prove the existence of a pullback attractor in $L^{2p-2}(\Omega)$. In order to do this, we need an additional condition of $g$

$$\int_{-\infty}^{t} e^{\lambda_{i}t} \|g'(t)\|_{L^{\infty}(\Omega)}^{m'} dt < +\infty, \quad \forall t \in \mathbb{R},$$

(3.18)

where $m, m'$ are defined as in (3.30).

**Lemma 3.3.** The process $\{U(t, \tau)\}$ associated to problem (1.1) has a pullback absorbing set in $L^{2p-2}(\Omega)$.

**Proof.** Multiplying (1.1) by $|u|^{p-2}u$ and integrating over $\Omega$, we get

$$\int_{\Omega} u_{t}|u|^{p-2}u dx + (p - 1) \int_{\Omega} (|\nabla_{x}u|^{2} + |x|^{2} |\nabla_{x}u|^{2})|u|^{p-2} dx + \int_{\Omega} f(u)|u|^{p-2} dx = \int_{\Omega} g(t)|u|^{p-2} dx.$$  

(3.19)

From (1.3) and the fact that $L^{p}(\Omega) \subset L^{2p-2}(\Omega)$ continuously, we have

$$\int_{\Omega} f(u)|u|^{p-2} dx \geq \int_{\Omega} (C_{1}|u|^{p} - C_{2})|u|^{p-2} dx \geq C_{1}\|u\|^{2p-2}_{L^{2p-2}(\Omega)} - C_{2}|u|^{p}.$$  

(3.20)

On the other hand, by Cauchy’s inequality, we see that

$$\left|\int_{\Omega} u_{t}|u|^{p-2} dx\right| \leq \frac{C_{1}}{4}\|u\|^{2p-2}_{L^{2p-2}(\Omega)} + \frac{1}{C_{1}}|u|^{2},$$  

(3.21)

$$\left|\int_{\Omega} g(t)|u|^{p-2} dx\right| \leq \frac{C_{1}}{4}\|u\|^{2p-2}_{L^{2p-2}(\Omega)} + \frac{1}{4}|g(t)|^{2}.$$  

(3.22)

Combining (3.19)–(3.22) imply that

$$\|u\|^{2p-2}_{L^{2p-2}(\Omega)} \leq C\left(|u_{t}|^{2} + |u|^{p} + |g(t)|^{2}\right).$$  

(3.23)

Applying (3.2) and Lemma 3.2, we conclude the existence of a pullback absorbing set in $L^{2p-2}(\Omega)$ for the process $U(t, \tau)$. \qed
Lemma 3.4. For any $s \in \mathbb{R}$, any $2 \leq p < \infty$, and any bounded set $B \subset L^2(\Omega)$, there exists $\tau_0$ such that

$$\int_\Omega |u_t(s)|^p \, dx \leq M, \quad \forall \tau \leq \tau_0, \; u_t \in B,$$

(3.24)

where $M$ depends on $s$, $p$ but not on $B$, and $u_t(s) = (d/dt)(U(t, \tau)u_t)|_{\tau=s}$.

Proof. We will prove the lemma by induction argument. Letting $\beta = N(s)/(N(s) - 2) > 1$ and denoting $v = u_t$ we prove that for $k = 0, 1, 2, \ldots$, there exist $\tau_k$ and $M_k(s)$ such that

$$e^{\lambda \tau_k} \int_\Omega |v(s)|^{2^\beta_k} \, dx \leq M_k(s) \quad \text{for any } u_t \in B, \tau \leq \tau_k,$$

($P_k$)

$$\int_s^{s+1} \left( e^{\lambda \tau} \int_\Omega |v(r)|^{2^\beta_{k+1}} \, dx \right)^{1/\beta} \, dr \leq M_k(s) \quad \text{for any } u_t \in B, \tau \leq \tau_k,$$

($Q_k$)

where $\tau_k$ depends on $k$ and $B$ and $M_k$ depends only on $k$.

For $k = 0$, we have ($P_0$) from (3.17). Integrating (3.16) and using $S^1_0(\Omega) \hookrightarrow L^{2^\beta}(\Omega)$ continuously, we get ($Q_0$).

Assuming that ($P_k$), ($Q_k$) hold, we prove so are ($P_{k+1}$) and ($Q_{k+1}$). Multiplying (3.14) by $|v|^{2^\beta_{k+1}-2}v$ and integrating over $\Omega$, we obtain

$$C \frac{d}{dt} \int_\Omega |v|^{2^\beta_{k+1}} \, dx + C \int_\Omega \left( |\nabla x_v|^2 + |x_1|^{2^\beta_k}|\nabla x_v|^2 \right) |v|^{2^\beta_{k+1}-2} \, dx$$

$$\leq \ell \int_\Omega |v|^{2^\beta_{k+1}} \, dx + \left( g'(t), |v|^{2^\beta_{k+1}-2} \, v \right).$$

(3.25)

Using the imbedding $S^1_0(\Omega) \hookrightarrow L^{2^\beta}(\Omega)$ once again, we get

$$\int_\Omega \left( |\nabla x_v|^2 + |x_1|^{2^\beta_k}|\nabla x_v|^2 \right) |v|^{2^\beta_{k+1}} \, dx = \|v|^{2^\beta_{k+1}} \|_{L^{2^\beta}(\Omega)}^2 = \left( \int_\Omega |v|^{2^\beta_{k+1}} \, dx \right)^{1/\beta}.$$

(3.26)

Combining Holder’s and Young’s inequalities, we see that

$$\int_\Omega g'(t)|v|^{2^\beta_{k+1}-2}v \, dx \leq \left( \int_\Omega |g'(t)|^m \, dx \right)^{1/m} \left( \int_\Omega |v|^{(2^\beta_{k+1}-1)n} \, dx \right)^{1/n}$$

$$\leq \left( \int_\Omega |g'(t)|^m \, dx \right)^{m'/m} + \left( \int_\Omega |v|^{(2^\beta_{k+1}-1)n} \, dx \right)^{n'/n},$$

(3.27)
where $1/m + 1/n = 1/m' + 1/n' = 1$. Choose $n, n'$ such that

$$
(2\beta^{k+1} - 1)n = 2\beta^{k+2}, \quad \frac{n'}{n} = \frac{1}{\beta'}
$$

thus

$$
n = \frac{2\beta^{k+2}}{2\beta^{k+1} - 1}, \quad n' = \frac{2\beta^{k+1}}{2\beta^{k+1} - 1}.
$$

Hence

$$
m = \frac{n}{n-1} = \frac{2\beta^{k+1} - 1}{2\beta^{k+2} - 2\beta^{k+1} + 1}, \quad m' = 2\beta^{k+1}.
$$

Then from (3.27), we infer that

$$
\int_{\Omega} g'(t)|v|^{2\beta^{k+2}} \, dx \leq \frac{1}{m'} \|g'(t)\|_{L^{n'}(\Omega)}^\beta + \frac{1}{n'} \left( \int_{\Omega} |v|^{2\beta^{k+2}} \, dx \right)^{1/\beta}.
$$

Applying (3.26) and (3.31) in (3.25), we find that

$$
\frac{d}{dt} \left( e^{\lambda t} \int_{\Omega} |v|^{2\beta^{k+1}} \, dx \right) + Ce^{\lambda t} \left( \int_{\Omega} |v|^{2\beta^{k+2}} \, dx \right)^{1/\beta} \leq Ce^{\lambda t} \int_{\Omega} |v|^{2\beta^{k+1}} \, dx + Ce^{\lambda t} \|g'(t)\|_{L^{n'}(\Omega)}^{\beta'}
$$

Combining (Q_k) and (3.2), using the uniform Gronwall inequality and taking into account assumption (3.18), we get \((P_{k+1})\). On the other hand, integrating (3.32) from $t$ to $t+1$, we find \((Q_{k+1})\). Now since $\beta > 1$, and taking $k \geq \log_{\beta'} p/2$, we get the desired estimate.

We will use the following lemma.

**Lemma 3.5** (see [15]). If there exists $\sigma > 0$ such that $\int_{-\infty}^{t} e^{|x|} \varphi(s)^2 \, ds < \infty$, for all $t \in \mathbb{R}$, then

$$
\lim_{\gamma \to +\infty} \int_{-\infty}^{t} e^{-\gamma (t-s)} \varphi(s)^2 \, ds = 0, \quad t \in \mathbb{R}.
$$

Let $H_m = \text{span}\{e_1, e_2, \ldots, e_m\}$ in $L^2(\Omega)$, and let $P_m : L^2(\Omega) \to H_m$ be the orthogonal projection, where $\{e_i\}_{i=1}^\infty$ are the eigenvectors of operator $A = -G_\sigma$. For any $u \in L^2(\Omega)$, we write

$$
u = P_m u + (I - P_m) u = u_1 + u_2.
$$
Lemma 3.6. For any $t \in \mathbb{R}$, any $B \subset L^2(\Omega)$ and any $\varepsilon$, there exist $\tau_0(t, B, \varepsilon)$ and $m_0 \in \mathbb{N}$ such that

$$|(I - P_m)v^2|_2 < \varepsilon, \quad \forall \tau \leq \tau_0, \forall u_\tau \in B, \ m \geq m_0. \quad (3.35)$$

Proof. Multiplying (3.14) by $v^2 = (I - P_m)v$ and then integrating over $\Omega$, using $|\nabla v^2|_2 \geq \lambda_m |v^2|_2$ and Cauchy’s inequality we get

$$\frac{d}{dt}|v^2|_2 + \lambda_m|v^2|_2 \leq C \int_{\Omega} |f'(u)v|^2 \, dx + C|g'(t)|_2^2. \quad (3.36)$$

We multiply (3.36) by $e^{knt}$ and use assumption (1.4). We get

$$\frac{d}{dt}(e^{knt}|v^2|_2^2) \leq Ce^{knt} \int_{\Omega} |u|^{2(p-2)}|v|^2 \, dx + Ce^{knt}|g'(t)|_2^2. \quad (3.37)$$

Integrating (3.37) from $s$ to $t$,

$$e^{knt}|v^2(t)|_2^2 \leq e^{kns}|v^2(s)|_2^2 + C \int_s^t e^{knt} \int_\Omega |u|^{2(p-2)}|v|^2 \, dx \, dr + C \int_s^t e^{knt} |g'(r)|_2^2 \, dr \leq e^{kns}|v^2(s)|_2^2 + C \int_{-\infty}^t e^{knt} \int_\Omega |u|^{2(p-2)}|v|^2 \, dx \, dr + C \int_{-\infty}^t e^{knt} |g'(r)|_2^2 \, dr. \quad (3.38)$$

Now integrating (3.38) with respect to $s$ from $\tau$ to $t$, we infer that

$$(t - \tau)e^{knt}|v^2(t)|_2^2 \leq \int_{\tau}^t e^{knt} |v(r)|^2_2 \, dr + C(t - \tau) \int_{-\infty}^t e^{knt} \int_\Omega |u|^{2(p-2)}|v|^2 \, dx \, dr + C(t - \tau) \int_{-\infty}^t e^{knt} |g'(r)|_2^2 \, dr. \quad (3.39)$$

Thus

$$|v^2(t)|_2^2 \leq \frac{1}{t - \tau} \int_{-\infty}^t e^{-\lambda_m(t-r)}|v(r)|^2_2 \, dr + C \int_{-\infty}^t e^{-\lambda_m(t-r)} \int_\Omega |u|^{2(p-2)}|v|^2 \, dx \, dr + C \int_{-\infty}^t e^{-\lambda_m(t-r)} |g'(r)|_2^2 \, dr. \quad (3.40)$$

By Lemma 3.5 and since $\lambda_m \to +\infty$ as $m \to +\infty$, there exist $\tau_1$ and $m_1$ such that

$$\frac{1}{t - \tau} \int_{-\infty}^t e^{-\lambda_m(t-r)} C \int_{-\infty}^t e^{-\lambda_m(t-r)} |g'(r)|_2^2 \, dr < \frac{\varepsilon}{3},$$

$$|v(r)|^2_2 \, dr < \frac{\varepsilon}{3}, \quad (3.41)$$
for all \( \tau \leq \tau_1 \) and \( m \geq m_1 \). For the second term of the right-hand side of (3.40), using Holder’s inequality we have

\[
\int_{-\infty}^{t} e^{-\lambda_m(t-r)} \int_{\Omega} |u|^2(p-2) |v|^2 \, dx \, dr \\
\leq \int_{-\infty}^{t} \left( \int_{\Omega} e^{((-p-1)/(p-2)\lambda_m)(t-r)} |u|^{2(p-2)} \, dx \right)^{(p-2)/(p-1)} \left( \int_{\Omega} e^{-(p-1)\lambda_m(t-r)} |v|^{2(p-2)} \, dx \right)^{1/(p-1)} \, dr \\
\leq \left( \int_{-\infty}^{t} e^{((-p-1)/(p-2)\lambda_m)(t-r)} \|u\|^{2(p-2)}_{L^{q-2}(\Omega)} \, dr \right)^{(p-2)/(p-1)} \left( \int_{-\infty}^{t} e^{-(p-1)\lambda_m(t-r)} \int_{\Omega} |v|^{2(p-2)} \, dx \right)^{1/(p-1)} .
\]

(3.42)

From Lemmas (3.5)–(3.7), we see that there exist \( \tau_2 \) and \( m_2 \in \mathbb{N} \) such that

\[
C \int_{-\infty}^{t} e^{-\lambda_m(t-r)} \int_{\Omega} |u|^{2(p-2)} |v|^2 \, dx \, dr < \frac{\varepsilon}{3}, \quad \forall \tau \leq \tau_0, \ m \geq m_2.
\]

(3.43)

Let \( \tau_0 = \min\{\tau_1, \tau_2\} \) and \( m_0 = \max\{m_1, m_2\} \), from (3.40), taking into account (3.41) and (3.43), we obtain (3.35).

\[\square\]

**Lemma 3.7** (see [9]). Let \( B \) be a bounded subset in \( L^q(\Omega) (q \geq 1) \). If \( B \) has a finite \( \varepsilon \)-net in \( L^q(\Omega) \), then there exists an \( M = M(B, \varepsilon) \), such that for any \( u \in B \), the following estimate is valid:

\[
\int_{\Omega(|u| \geq M)} |u|^q \, dx < \varepsilon.
\]

(3.44)

Using Lemma 3.7 and taking into account Lemmas 3.2 and 3.6 we conclude that the set \( \{u_t(s) : s \leq t, u_\tau \in B\} \) has a finite \(\varepsilon\)-net in \( L^2(\Omega) \). Therefore, we get the following result.

**Lemma 3.8.** For any \( t \in \mathbb{R} \), any \( B \subset L^2(\Omega) \) that is bounded, and any \( \varepsilon > 0 \), there exists \( \tau_0 \leq t \) and \( M_0 > 0 \) such that

\[
\int_{\Omega(|u| \geq M)} |u|^q(t)^2 \, dx < \varepsilon, \quad \forall \tau < \tau_0, \ M > M_0, \ u_\tau \in B.
\]

(3.45)

**Lemma 3.9** (see [9]). For any \( t \in \mathbb{R} \), any bounded set \( B \subset L^2(\Omega) \), and any \( \varepsilon > 0 \), there exist \( \tau_0 \) and \( M_0 > 0 \) such that

\[
\text{mes}(\Omega(u(t) \geq M)) < \varepsilon \quad \forall \tau \leq \tau_0, \ M \geq M_0, \ u_\tau \in B,
\]

(3.46)

where \( \text{mes} \) is the Lebesgue measure in \( \mathbb{R}^N \) and \( \Omega(u(t) \geq M) = \{x \in \Omega : u(t, x) \geq M\} \).

**Lemma 3.10** (see [2]). Let \( \{U(t, \tau)\} \) be a norm-to-weak continuous process in \( L^2(\Omega) \) and \( L^q(\Omega), q \geq 2 \). Then \( \{U(t, \tau)\} \) is pullback asymptotically compact in \( L^q(\Omega) \) if
Abstract and Applied Analysis

(i) \( \{U(t, \tau)\} \) is pullback asymptotically compact in \( L^2(\Omega) \);

(ii) for any \( t \in \mathbb{R} \), any bounded set \( D \subset L^2(\Omega) \), and any \( \varepsilon > 0 \), there exist \( M > 0 \) and \( \tau_0 \leq t \)

\[
\sup_{\tau \leq \tau_0} \sup_{u \in D} \left( \int_{\Omega} |U(t, \tau)u| \right)^p \leq C \varepsilon, \quad (3.47)
\]

where \( C \) is independent of \( M, \tau, u_\tau, \) and \( \varepsilon \).

We are now ready to prove the existence of a pullback attractor in \( L^{2p-2}(\Omega) \).

**Theorem 3.11.** Assume that assumptions (1.3)–(1.7) and (3.18) hold. Then the process \( \{U(t, \tau)\} \)
associated to problem (1.1) possesses a pullback attractor \( \mathcal{A}_{2p-2} = \{A_{2p-2}(t)\}_{t \in \mathbb{R}} \) in \( L^{2p-2}(\Omega) \).

**Proof.** Because of Lemma 3.10, since \( \{U(t, \tau)\} \) has a pullback absorbing set in \( L^{2p-2}(\Omega) \),
we only have to prove that for any \( t \in \mathbb{R} \), any \( B \subset L^2(\Omega) \), and any \( \varepsilon > 0 \), there exist \( \tau_2 \leq t \) and \( M_2 > 0 \) such that

\[
\int_{\Omega} |u|^{2p-2} \leq C \varepsilon, \quad \forall \tau \leq \tau_2, \; M \geq M_2, \; u_\tau \in B. \quad (3.48)
\]

Taking the inner product of (1.1) with \( (u - M)_+^{p-1} \) in \( L^2(\Omega) \), where

\[
(u - M)_+ = \begin{cases} 
    u - M & \text{if } u \geq M, \\
    0 & \text{if } u < M,
\end{cases} \quad (3.49)
\]

we have

\[
\int_{\Omega} u_i (u - M)_+^{p-1} dx + (p - 1) \int_{\Omega} \left( |\nabla x_i u|^2 + |x_i|^2 |\nabla x_i u|^2 \right) (u - M)_+^{p-2} dx \\
+ \int_{\Omega} f(u) (u - M)_+^{p-1} dx \\
\leq \int_{\Omega} g(t) (u - M)_+^{p-1} dx. \quad (3.50)
\]

Some standard computations give us

\[
\int_{\Omega} f(u) (u - M)_+^{p-1} dx \geq C \int_{\Omega} |u|^{2p-2} dx + C \int_{\Omega} |u|^p dx, \quad (3.51)
\]

\[
- \int_{\Omega} u_i (u - M)_+^{p-1} dx \leq \frac{C}{4} \int_{\Omega} |u|^{2p-2} dx + \frac{1}{C} \int_{\Omega} |u|^2 dx, \quad (3.52)
\]

\[
\int_{\Omega} g(t) (u - M)_+^{p-1} dx \leq \frac{C}{4} \int_{\Omega} |u|^{2p-2} dx + \frac{1}{C} \int_{\Omega} |g(t)|^2 dx. \quad (3.53)
\]
Combining (3.50)–(3.53), we find
\[
\int_{\Omega(u \geq M)} |u|^{2p-2} dx \leq C \left( \int_{\Omega(u \geq M)} |u|^2 dx + \int_{\Omega(u \geq M)} |g(t)|^2 dx + C \int_{\Omega(u \geq M)} |u|^p dx \right). \tag{3.54}
\]
Applying Lemmas 3.7 and 3.8 to (3.54) we find there exist \( \tau_0 \) and \( M_0 \) such that
\[
\int_{\Omega(u \geq M)} |u|^{2p-2} dx < \epsilon \quad \forall \tau \leq \tau_0, \ M \geq M_0. \tag{3.55}
\]
Repeating the above arguments with \( |(u + M)_-|^{p-2}(u + M)_- \) in place of \( (u - M)_+ \), we have
\[
\int_{\Omega(u \leq -M)} |u|^{2p-2} dx < \epsilon \quad \forall \tau \leq \tau_1, \ M \geq M_1, \tag{3.56}
\]
for some \( \tau_1 \leq \ell \) and \( M_1 > 0 \), where
\[
(u + M)_- = \begin{cases} u + M & \text{if } u \leq -M, \\ 0 & \text{if } u > M. \end{cases} \tag{3.57}
\]
Letting \( \tau_2 = \min\{\tau_0, \tau_1\} \) and \( M_2 = \max\{M_0, M_1\} \) we have
\[
\int_{\Omega(|u| \geq M_2)} |u|^{2p-2} dx < C\epsilon, \quad \forall \tau \leq \tau_2, \ M \geq M_2. \tag{3.58}
\]
This completes the proof. \( \square \)

### 3.2. Existence of a Pullback Attractor in \( S_0^2(\Omega) \)

In this section, we prove the existence of a pullback attractor in \( S_0^2(\Omega) \).

**Lemma 3.12.** The process \( \{U(t, \tau)\} \) associated to (1.1) has a pullback absorbing set in \( S_0^2(\Omega) \).

**Proof.** We multiply (1.1) by \( -G_u u \); then, using \( f(0) = 0 \), we have
\[
\|u\|^2_{S_0^2(\Omega)} = \int_{\Omega} u G_u u dx - \int_{\Omega} f'(u) \left( \nabla u, u \right) dx - \int_{\Omega} g(t) G_u u dx. \tag{3.59}
\]
Using \( f'(u) \geq -\epsilon \), Cauchy's inequality, and argument as in Lemma 3.3, from (3.59) we have
\[
\|u\|^2_{S_0^2(\Omega)} \leq 2 \left( |u|^2_2 + \epsilon \|u\|^2 + ||g(t)||^2_2 \right). \tag{3.60}
\]
Taking into account (3.11), the proof is complete. \( \square \)
In order to prove the existence of the pullback attractor in $S_0^2(\Omega)$, we will verify so-called “(PDC) condition”, which is defined as follow

**Definition 3.13.** A process $\{U(t, \tau)\}$ is said to satisfy (PDC) condition in $X$ if for any $t \in \mathbb{R}$, any bounded set $B \subset L^2(\Omega)$ and any $\varepsilon > 0$, there exists $\tau_0 \leq t$ and a finite dimensional subspace $X_1$ of $X$ such that

(i) $P(\bigcup_{\tau \leq \tau_0} U(t, \tau)B)$ is bounded in $X$; and

(ii) $\| (I_X - P) U(t, \tau) u_\tau \|_X < \varepsilon$, for all $\tau \leq \tau_0$ and $u_\tau \in B$, where $P : X \to X_1$ is a canonical projection and $I_X$ is the identity.

**Lemma 3.14** (see [13]). If a process $\{U(t, \tau)\}$ satisfies (PDC) condition in $X$ then it is pullback asymptotically compact in $X$. Moreover, if $X$ is convex then the converse is true.

**Lemma 3.15** (see [9]). Assume that $f$ satisfies (1.3) and (1.5). Then for any subset $A \subset L^{2p-2}(\Omega)$, if $\kappa(A) < \varepsilon$ in $L^{2p-2}(\Omega)$, then we have

$$\kappa(f(A)) < C \varepsilon \text{ in } L^2(\Omega),$$

where the Kuratowski noncompactness measure $\kappa(B)$ in a Banach space $X$ defined as

$$\kappa(B) = \inf\{ \delta : B \text{ has a finite covering by balls in } X \text{ with radii } \delta \}.$$

**Theorem 3.16.** Assume that $f$ satisfies (1.3)–(1.5), $g$ satisfies (1.7) and (3.18). Then the process $\{U(t, \tau)\}$ generated by (1.1) has a pullback attractor $\mathcal{A} = \{A(t) : t \in \mathbb{R}\}$ in $S_0^2(\Omega)$.

**Proof.** We consider a complete trajectory $u(t)$ lies on pullback attractor $\mathcal{A}_{2p-2}$ in $L^{2p-2}(\Omega)$ for $U(t, \tau)$, that is, $u(t) \in \mathcal{A}_{2p-2}(t)$ and $U(t, \tau)u_\tau = u(t)$, for all $t \geq \tau$. Denoting $A = -G_s$ and multiplying (1.1) by $Au_2 = A(I - P_m)u = (I - P_m)Au$ we have

$$\langle u_2, Au_2 \rangle + \|u_2\|_{S_0^2(\Omega)}^2 + \int_\Omega f(u)Au_2dx = (g(t), Au_2).$$

Using Holder’s inequality we get

$$\|u_2\|_{S_0^2(\Omega)}^2 \leq C \left( \| (I - P_m)u_2 \|_2^2 + \| (I - P_m)g(t) \|_2^2 + \int_\Omega (f(u))^2dx \right).$$

Thanks to Lemmas 3.6 and 3.15 and the fact that $g \in C_{loc}(\mathbb{R}; L^2(\Omega))$, we see that $\{U(t, \tau)\}$ satisfies condition (PDC) in $S_0^2(\Omega)$. Now from Lemmas 3.3 and 3.14 we get the desired result.

**4. Exponential Growth in $S_0^2(\Omega) \cap L^{2p-2}(\Omega)$ of Pullback Attractors**

In this section, we will give an exponential growth condition in $S_0^2(\Omega) \cap L^{2p-2}(\Omega)$ for the pullback attractor $\mathcal{A}(\tau)$.

First, we recall a result in [17] which is necessary for the proof of our results.
Lemma 4.1. Let $X$, $Y$ be Banach spaces such that $X$ is reflexive, and the inclusion $X \subset Y$ is continuous. Assume that $\{u_n\}$ is bounded sequence in $L^\infty(t_0,T;X)$ such that $u_n \rightarrow u$ weakly in $L^q(t_0,T;X)$ for some $q \in [1, +\infty)$ and $u \in C^0([t_0,T];Y)$. Then, $u(t) \in X$ for all $t \in [t_0, T]$ and

$$
\|u\|_X \leq \sup_{n \geq 1}\|u_n\|_{L^\infty(t_0,T;X)}, \quad \forall t \in [t_0, T].
$$

(4.1)

In the following theorem, instead of evaluating the functions $u_n$ which are differentiable enough and then using Lemma 4.1, we will formally evaluate the function $u$.

Theorem 4.2. Assume that $f$ satisfies (1.3)-(1.5), $g$ satisfies (H 2), (3.18) and the following conditions

$$
\lim_{\tau \rightarrow -\infty} e^{\lambda_1 \tau} \int_{-\tau}^{r+1} \|g'(s)\|_2^2 ds = 0,
$$

$$
\lim_{\tau \rightarrow -\infty} (e^{\lambda_1 \tau} \|g(s)\|_2) = 0.
$$

(4.2)

Then $\mathcal{A}(\tau)$ satisfies

$$
\lim_{\tau \rightarrow -\infty} e^{\lambda_1 \tau} \sup_{w \in \mathcal{A}(\tau)} \sup_{\|w\|_{L^2(\Omega)}} \left\{ \sup_{\|w\|_{\bar{S}^2(\Omega)}} \|w\|_{L^2(\Omega)}^2 + \sup_{\|w\|_{\bar{S}^2(\Omega)}} \|w\|_{S^2(\Omega)}^2 \right\} = 0.
$$

(4.3)

Proof. We differentiate with respect to time in (1.1), then multiply by $u_t$, we get

$$
\frac{1}{2} \frac{d}{dr} |u'(r)|_2^2 + |u(r)|^2 = -\int_{\Omega} f'(u)u'(r)u'(r)dx + \int_{\Omega} g'(r)u'(r)dx
$$

$$
\leq \ell |u'(r)|_2^2 + \frac{1}{2} u'(r)_2^2 + \frac{1}{2} |g'(r)|_2^2.
$$

(4.4)

Integrating in the last inequality, in particular, we get

$$
|u'(r)|_2^2 \leq |u'(s)|_2^2 + (2\ell + 1) \int_{r+\epsilon/2}^{r} |u'(\theta)|_2^2 d\theta + \int_{r+\epsilon/2}^{t} |g'(\theta)|_2^2 d\theta.
$$

(4.5)

for all $r + \epsilon/2 \leq s \leq r \leq t$. Now, integrating with respect to $s$, between $r + \epsilon/2$ and $r$

$$
(r - r - \frac{\epsilon}{2}) |u'(r)|_2^2 \leq \left[ (r - r - \frac{\epsilon}{2}) (2\ell + 1) + 1 \right] \int_{r+\epsilon/2}^{r} |u'(\theta)|_2^2 d\theta
$$

$$
+ \left( r - r - \frac{\epsilon}{2} \right) \int_{r+\epsilon/2}^{r} |g'(\theta)|_2^2 d\theta.
$$

(4.6)
Abstract and Applied Analysis

for all \( \tau + \epsilon/2 \leq r \leq t \), in particular,

\[
|u'(r)|_2^2 \leq 2\epsilon^{-1}\left[\left(r - \tau - \frac{\epsilon}{2}\right)(2l + 1) + 1\right] \int_{\tau+\epsilon/2}^{t} |u'(\theta)|_2^2 d\theta + \int_{\tau+\epsilon/2}^{t} |g'(\theta)|_2^2 d\theta. 
\]  

(4.7)

for all \( r \in [\tau + \epsilon, t] \).

Multiplying (1.1) by \( u \) and then integrating on \( \Omega \), we get

\[
\frac{1}{2} \frac{d}{dt} |u|^2 + \int_{\Omega} f(u)u \, dx = \int_{\Omega} g(t)u \, dx \leq \frac{1}{2\lambda_1} |g(t)|_2^2 + \frac{\lambda_1}{2} |u|^2. 
\]  

Using hypothesis (H1) and the fact that \( |u|^2 \geq (1/2)|u|^2 + (\lambda_1/2)\lambda_1 \frac{u^2}{2} \), we have

\[
\frac{d}{dt} |u|^2 + \lambda_1 |u|^2 + 2C_1 |u|^p - 2C_2 |\Omega| \leq \frac{1}{\lambda_1} |g(t)|_2^2. 
\]  

(4.9)

Integrating (4.9) from \( \tau \) to \( r \in [\tau, t] \), we have

\[
|u(r)|_2^2 + \lambda_1 \int_{\tau}^{r} |u(s)|^2 ds + 2C_1 \int_{\tau}^{r} |u(s)|^p ds \leq |u(\tau)|_2^2 + \frac{1}{\lambda_1} \int_{\tau}^{r} |g(s)|_2^2 ds + 2C_2 |\Omega|(t - \tau). 
\]  

(4.10)

Thus,

\[
|u(r)|_2^2 + \int_{\tau}^{r} |u(s)|^2 ds + \int_{\tau}^{r} |u(s)|^p ds \leq C \left[ |u(\tau)|_2^2 + \int_{\tau}^{r} |g(s)|_2^2 ds + (t - \tau) \right].
\]  

(4.11)

Multiplying (1.1) by \( u_t \) then integrating over \( \Omega \), we have

\[
|u'(r)|_2^2 + \frac{1}{2} \frac{d}{dr} \left( |u(r)|^2 + 2 \int_{\Omega} F(u(x,r)) \, dx \right) \leq \frac{1}{2} |g(r)|_2^2 + \frac{1}{2} |u'(r)|_2^2. 
\]  

(4.12)

Integrating now between \( s \in [\tau, r] \) and \( r \leq t \), we obtain

\[
\int_{s}^{r} |u'(\theta)|_2^2 d\theta + |u(r)|^2 + \int_{\Omega} F(u(x,r)) \, dx \leq \int_{s}^{r} |g(\theta)|_2^2 d\theta + |u(s)|^2 + \int_{\Omega} F(u(x,s)) \, dx. 
\]  

(4.13)

From (4.13) and using hypothesis (H1), we get

\[
\int_{s}^{r} |u'(\theta)|_2^2 d\theta + |u(r)|^2 + a_1 \int_{\Omega} |u(x,r)|^p \, dx - a_2 |\Omega| \leq |u(s)|^2 + \int_{s}^{r} |g(\theta)|_2^2 d\theta + a_3 \int_{\Omega} |u(x,r)|^p \, dx + a_4 |\Omega|. 
\]  

(4.14)
Hence
\[
\int_s^r \left| u'(\theta) \right|^2 d\theta + \|u(r)\|^2 + \alpha_1 u(r)_p^p \leq \|u(s)\|^2 + \int_s^t \left| g(\theta) \right|^2 d\theta + \alpha_3 |u(s)|_p^p + (\alpha_2 + \alpha_4)|\Omega|. \tag{4.15}
\]

Integrating inequality (4.15) with respect to \( s \) from \( \tau \) to \( r \), we obtain
\[
\begin{align*}
(r - \tau) \left[ \|u(r)\|^2 + |u(r)|_p^p \right] \\
& \leq C \left[ \int_{\tau}^r \|u(s)\|^2 ds + \int_{\tau}^r |u(s)|_p^p ds \right] + C(t - \tau) \int_{\tau}^t \|g(s)\|^2 ds + C|\Omega|(t - \tau),
\end{align*}
\]
for all \( t \geq \tau, r \in [\tau, t] \).

From (4.16) and (4.11), we obtain that
\[
\|u(r)\|^2 + |u(r)|_p^p \leq C \left[ u_2^2 + \int_{\tau}^{r+2} \|g(s)\|^2 ds + 1 \right], \tag{4.17}
\]
for all \( r \in [\tau + 1, \tau + 2] \).

From (4.7), taking \( t = \tau + 3 \) and \( \epsilon = 2 \) we have
\[
\left| u'(r) \right|_2^2 \leq (4I + 3) \int_{\tau + 1}^{r+3} \left| u'(\theta) \right|_2^2 d\theta + \int_{\tau + 1}^{r+3} \left| g'(\theta) \right|_2^2 d\theta, \tag{4.18}
\]
for all \( r \in [\tau + 2, \tau + 3] \).

Analogously, and if we take \( s = \tau + 1 \) and \( r = t = \tau + 3 \) in inequality (4.15), then
\[
\begin{align*}
\int_{\tau + 1}^{r+3} \left| u'(s) \right|_2^2 ds + \|u(r + 3)\|^2 + \alpha_1 |u(r + 3)|_p^p \\
& \leq \|u(\tau + 1)\|^2 + \int_{\tau}^{r+3} \|g(s)\|^2 ds + \alpha_3 |u(\tau + 1)|_p^p + (\alpha_2 + \alpha_4)|\Omega|. \tag{4.19}
\end{align*}
\]

From (4.18) and (4.19), we obtain
\[
\begin{align*}
\left| u'(r) \right|_2^2 & \leq (4I + 3) \left[ \|u(\tau + 1)\|^2 + \alpha_3 |u(\tau + 1)|_p^p \right] \\
& \quad + (4I + 3) \left[ (\alpha_2 + \alpha_4)|\Omega| + \int_{\tau}^{r+3} \|g(s)\|^2 ds \right] + \int_{\tau + 1}^{r+3} \left| g'(\theta) \right|_2^2 d\theta \tag{4.20}
\end{align*}
\]
for all \( r \in [\tau + 2, \tau + 3] \).

Owing to this inequality and (4.17), we have
\[
\left| u'(r) \right|_2^2 \leq C \left[ u_2^2 + \int_{\tau}^{r+3} \left[ \|g(s)\|^2 + \|g'(s)\|^2 \right] ds + 1 \right], \tag{4.21}
\]
for all \( r \in [\tau + 2, \tau + 3] \).
Abstract and Applied Analysis

From (3.23), (3.60) and using Young’s inequality, we have
\[
\|u(r)\|_{L^{p-2}(\Omega)}^{2} + \|u(r)\|_{S_{0}^{0}(\Omega)}^{2} \leq C \left( \|u'(r)\|_{2}^{2} + \|u(r)\|^{2} + \|u(r)\|_{p}^{p} + 1 + |g(r)|_{2}^{2} \right), \tag{4.22}
\]
for all \( r \geq \tau \).

From (4.22) and thank to (4.21), we have
\[
\|u(r)\|_{L^{p-2}(\Omega)}^{2} + \|u(r)\|_{S_{0}^{0}(\Omega)}^{2} \leq C \left[ \|u_{\tau}\|_{2}^{2} + \int_{\tau}^{r+3} \left( |g(s)|_{2}^{2} + |g'(s)|_{2}^{2} \right) ds + 1 \right]
+ C \left( \|u(r)\|^{2} + \|u(r)\|_{p}^{p} + |g(r)|_{2}^{2} \right) \tag{4.23}
\]
for all \( r \in [\tau + 2, \tau + 3] \). From (4.23) and thanks to (4.17), we have
\[
\|u(r)\|_{L^{p-2}(\Omega)}^{2} + \|u(r)\|_{S_{0}^{0}(\Omega)}^{2} \leq C \left[ \|u_{\tau}\|_{2} + \int_{\tau}^{r+3} \left( |g(s)|_{2}^{2} + |g'(s)|_{2}^{2} \right) ds + 1 + \sup_{r \in [\tau + 2, r + 3]} |g(r)|_{2}^{2} \right], \tag{4.24}
\]
for all \( r \in [\tau + 2, \tau + 3] \). Now, observe that by Cauchy’s inequality
\[
|g(r)| \geq |g(\tau + 2)| + \left( \int_{\tau + 2}^{r+3} |g'(s)|_{2}^{2} ds \right)^{1/2}, \tag{4.25}
\]
for all \( r \in [\tau + 2, \tau + 3] \), \( \tau \in \mathbb{R} \), \( u_{\tau} \in L^{2}(\Omega) \).

Thus, from (4.23), we have
\[
\|U(\tau + 2, \tau)u_{\tau}\|_{L^{p-2}(\Omega)}^{2} + \|U(\tau + 2, \tau)u_{\tau}\|_{S_{0}^{0}(\Omega)}^{2} \leq C \left[ \|u_{\tau}\|_{2}^{2} + \int_{\tau}^{r+3} \left( |g(s)|_{2}^{2} + |g'(s)|_{2}^{2} \right) ds + 1 + |g(\tau + 2)|_{2}^{2} \right]. \tag{4.26}
\]
for all \( \tau \in \mathbb{R} \), \( u_{\tau} \in L^{2}(\Omega) \). From this inequality, and the fact that \( \mathcal{A}(\tau) = U(\tau, \tau - 2)A(\tau - 2) \), we obtain
\[
\|v\|_{L^{p-2}(\Omega)}^{2} + \|v\|_{S_{0}^{0}(\Omega)}^{2} \leq C \left[ \sup_{w \in A(\tau - 2)} |w|_{2}^{2} + \int_{\tau - 2}^{\tau+1} \left( |g(s)|_{2}^{2} + |g'(s)|_{2}^{2} \right) ds + 1 + |g(\tau)|_{2}^{2} \right]. \tag{4.27}
\]
for all \( v \in A(\tau) \), and any \( \tau \in \mathbb{R} \). Now, thank to (4.2), (4.3), we obtain (4.3) from (4.27).
