We will discuss some operator inequalities on chaotic order about several operators, which are generalization of Furuta inequality and show monotonicity of related Furuta type operator function.

1. Introduction

An operator $T$ is said to be positive (denoted by $T \geq 0$) if $(Tx, x) \geq 0$ for all vectors $x$ in a Hilbert space, and $T$ is said to be strictly positive (denoted by $T > 0$) if $T$ is positive and invertible.

Theorem LH (Löwner-Heinz inequality, denoted by (LH) briefly). If $A \geq B \geq 0$ holds, then $A^\alpha \geq B^\alpha$ for any $\alpha \in [0, 1]$.

This was originally proved in [1, 2] and then in [3]. Although (LH) asserts that $A \geq B \geq 0$ ensures $A^\alpha \geq B^\alpha$ for any $\alpha \in [0, 1]$, unfortunately $A^\alpha \geq B^\alpha$ does not always hold for $\alpha > 1$. The following result has been obtained from this point of view.

Theorem F (Furuta inequality). If $A \geq B \geq 0$, then for each $r \geq 0$,

(i) $(B^{r/2} A B^{r/2})^{1/q} \geq (B^{r/2} B^{r/2})^{1/q}$,

(ii) $(A^{r/2} A^p A^{r/2})^{1/q} \geq (A^{r/2} B^p A^{r/2})^{1/q}$

hold for $p \geq 0$ and $q \geq 1$ with $(1 + r)q \geq p + r$.

The original proof of Theorem F is shown in [4], an elementary one-page proof is in [5], and alternative ones are in [6, 7]. We remark that the domain of the parameters $p, q,$ and $r$ in Theorem F is the best possible for the inequalities (i) and (ii) under the assumption $A \geq B \geq 0$; see [8].

We write $A \gg B$ if $\log A \geq \log B$ for $A, B > 0$, which is called the chaotic order.

Theorem A. For $A, B > 0$, the following (i) and (ii) hold:

(i) $A \gg B$ holds if and only if $A^r \geq (A^{r/2} B^p A^{r/2})^{(p + r)/(p + r)}$ for $p, r \geq 0$;

(ii) $A \gg B$ holds if and only if for any fixed $\delta \geq 0$, $F_{A,B}(p, r) = A^{-\delta/2} (A^{r/2} B^p A^{r/2})^{(\delta + r)/(p + r)} A^{-\delta/2}$ is a decreasing function of $p \geq \delta$ and $r \geq 0$.

(i) in Theorem A is shown in [9, 10], an excellent proof in [11], a proof in the case $p = r$ in [12], (ii) in [9, 10], and so forth.

Lemma B (see [11]). Let $A$ be a positive invertible operator, and let $B$ be an invertible operator. For any real number $\lambda$,

$$(BAB^*) = BA^{1/2} (A^{1/2} B^* B^{1/2}) A^{-1} A^{1/2} B^*.$$  (1)

Definition 1. Let $A, A_{n-1}, \ldots, A_1, B \geq 0, r_1, r_2, \ldots, r_n \geq 0$, and $p_1, p_2, \ldots, p_n \geq 0$ for a natural number $n$.

Let $C_{A_n}[n]$ be defined by

$$C_{A_n,[n]} = A_n^{r_{n/2}} A_{n-1}^{r_{n-1/2}} \cdots A_1^{r_{1/2}} \left\{ A_2^{r_2/2} \left( A_1^{r_1/2} B^{p_1} A_1^{r_1/2} \right)^{p_1} A_2^{-r_2/2} \right\}^{p_1} \cdots A_{n-1}^{r_{n-1}/2} A_n^{-r_n/2}. $$  (2)
For example,
\[ C_{A,B}[2] = A_{2}^{r/2} \left( A_{1}^{r/2} B^{p_{1}} A_{1}^{r/2} \right)^{p_{1}} A_{2}^{r/2}, \]
\[ C_{A,B}[4] = A_{4}^{r/2} \left( A_{2}^{r/2} \left( A_{1}^{r/2} B^{p_{1}} A_{1}^{r/2} \right)^{p_{1}} A_{2}^{r/2} \right)^{p_{1}} \times A_{3}^{r/2} \right)^{p_{1}} A_{4}^{r/2}. \] (3)

Let \( q[n] \) be defined by
\[ q[n] = \left[ (p_{1} + r_{1}) p_{2} + r_{2} \right] p_{3} + \cdots + r_{n-1} p_{n} + r_{n}. \] (4)

For example,
\[ q[1] = p_{1} + r_{1}, \quad q[2] = (p_{1} + r_{1}) p_{2} + r_{2}, \]
\[ q[4] = \left[ (p_{1} + r_{1}) (p_{2} + r_{2}) p_{3} + r_{3} \right] p_{4} + r_{4}. \]

For the sake of convenience, we define
\[ C_{A,B}[0] = B, \quad q[0] = 1, \] (6)
and these definitions in (6) may be reasonable by (2) and (4).

**Lemma 2.** For \( A_{n}, A_{n-1}, \ldots, A_{2}, A_{1}, B \geq 0 \) and any natural number \( n \), we have

(i) \( C_{A,B}[n] = A_{n}^{r/2} C_{A,B}[n-1]^{p_{n}} A_{n}^{r/2} \),
(ii) \( q[n] = q[n-1] + p_{n} + r_{n} \).

**Proof.** (i) and (ii) can be easily obtained by definitions (2) and (4). \( \Box \)

## 2. Basic Results Associated with \( C_{A,B}[n] \) and \( q[n] \)

We will give some operator inequalities on chaotic order, and Theorem 5 is further extension of Theorem 3.1 in [13].

**Lemma 3.** If \( A \gg B \), for \( p \geq 0 \) and \( r \geq 0 \), then \( A \gg (A^{r/2} B^{p} A^{r/2})^{1/(p+r)} \).

**Proof.** Since \( A \gg B \), we can obtain the following inequality.
\[ A^r \geq (A^{r/2} B^{p} A^{r/2})^{r/(p+r)} \] holds for \( p \geq 0 \) and \( r \geq 0 \) by (i) of Theorem A.

Take the logarithm on both sides of the previous inequality; that is,
\[ \log A^r \geq \log \left( A^{r/2} B^{p} A^{r/2} \right)^{r/(p+r)}, \] (7)
therefore we have
\[ A \gg \left( A^{r/2} B^{p} A^{r/2} \right)^{1/(p+r)}. \] (8)

**Theorem 4.** If \( A_{n} \gg A_{n-1} \gg \cdots \gg A_{2} \gg A_{1} \gg B \) and \( r_{1}, r_{2}, \ldots, r_{n} \geq 0, p_{1}, p_{2}, \ldots, p_{n} \geq 0 \) for a natural number \( n \). Then the following inequality holds:
\[ A_{n} \gg C_{A,B}[n]^{1/q[n]}, \] (9)

where \( C_{A,B}[n] \) and \( q[n] \) are defined in (2) and (4).

**Proof.** We will show (9) by mathematical induction. In the case \( n = 1 \),

\[ A_{1} \gg \left( A_{1}^{r/2} B^{p} A_{1}^{r/2} \right)^{1/(p+r)} \] (10)
holds for any \( p_{1} \geq 0 \) and \( r_{1} \geq 0 \) by Lemma 3, whence (9) for \( n = 1 \).

Assume that (9) holds for a natural number \( k \) (\( 1 \leq k < n \)). We will show that (9) holds \( r_{1}, r_{2}, \ldots, r_{k}, r_{k+1} \geq 0 \) and \( p_{1}, p_{2}, \ldots, p_{k}, p_{k+1} \geq 0 \) for \( k + 1 \).

Put \( D = A_{k+1}, E = A_{k}, F = C_{A,B}[k]^{1/q[k]} \), and (9) holds for \( n = k \) implying
\[ D \gg E \gg F > 0. \] (11)

Equation (11) yields the following by Lemma 3, for \( r \geq 0 \) and \( p \geq 0 \):
\[ D \gg (D^{r/2} F^{p} D^{r/2})^{1/(p+r)}, \] (12)
that is,
\[ A_{k+1} \gg \left( A_{k+1}^{r/2} C_{A,B}[k]^{p/q[k]} A_{k+1}^{r/2} \right)^{1/(p+r)}. \] (13)

Put \( r = r_{k+1}, p = q[k] p_{k+1} \) in (13), then by (ii) of Lemma 2, the exponential power \( 1/(p+r) \) of the right hand side of (13) can be written as follows:
\[ \frac{1}{p+r} = \frac{1}{q[k] p_{k+1} + r_{k+1}} = \frac{1}{q[k] + 1}, \]
and we have the following desired (15) by (12) and (13):
\[ A_{k+1} \gg \left( A_{k+1}^{r/2} C_{A,B}[k]^{p_{k+1}/q[k]} A_{k+1}^{r/2} \right)^{1/q[k+1]} \]
\[ = C_{A,B}[k+1]^{1/q[k+1]}, \] (15)
so that (15) shows that (9) holds for \( k + 1 \). \( \Box \)
Theorem 5. If $A_n \gg A_{n-1} \gg \cdots \gg A_2 \gg A_1 \gg B$ and $r_1, r_2, \ldots, r_n \geq 0$ for a natural number $n$. For any fixed $\delta \geq 0$, let $p_1, p_2, \ldots, p_n$ be satisfied by

$$
p_1 \geq \delta,
$$
$$
p_2 \geq \frac{\delta + r_1}{p_1 + r_1},
$$
$$
\vdots
$$
$$
p_k \geq \left( \frac{\delta + r_1 + \cdots + r_{k-1}}{q[k-1]} \right),
$$
$$
\vdots
$$
$$
p_n \geq \frac{\delta + r_1 + \cdots + r_{n-1}}{q[n-1]}.
$$

The operator function $I_k(p_k, r_k)$ for any natural number $k$ such that $1 \leq k \leq n$ is defined by

$$
I_k(p_k, r_k) = A_{k+1}^{-r_{k+1}/2} C_{A_k,n}[k]^{(\delta + r_1 + \cdots + r_k)/q[k]} A_k^{r_k/2}.
$$

Then the following inequality holds:

$$
A_{k+1}^{-r_{k+1}/2} I_{k-1}(p_{k-1}, r_{k-1}) A_{k-1}^{r_{k-1}/2} \geq I_k(p_k, r_k)
$$

for every natural number $k$ such that $1 \leq k \leq n$, where $C_{A,n}[n]$ and $q[n]$ are defined in (2) and (4).

Proof. Since $C_{A,n}[0] = B$, $q[0] = 1$ in (6), we may define

$$
I_0(p_0, r_0) = B^\delta
$$

for $p_0 = r_0 = 0$.

Because $A_1 \gg B$, then for any fixed $\delta \geq 0$,

$$
B^\delta \geq A_{1+1}^{-r_{1+1}/2} \left( A_1^{r_1/2} B^\delta A_1^{r_1/2} \right)^{(\delta + r_1)/q[k]} A_1^{-r_1/2}
$$

for $p_1 \geq \delta$, $r_1 \geq 0$,

since $F_{A,n}^{\delta, r_0} \geq F_{A,n}^{p_1, r_1}$ holds by (ii) of Theorem A. And (19) can be expressed as

$$
B^\delta \geq A_{0+1}^{r_0/2} I_0(p_0, r_0) A_{0+1}^{r_0/2} \geq I_1(p_1, r_1).
$$

We can apply Theorem 4, and we have the following (21) for any natural number $k$ such that $1 \leq k \leq n$:

$$
A_{k+1} \gg A_k \gg C_{A,n}[k]^{1/q[k]}.
$$

Since $X \gg Y$ implies that $X^t \gg Y^t$ holds for any $t \geq 0$, (21) ensures

$$
A_{k+1}^{\delta + r_1 + \cdots + r_k} \geq C_{A,n}[k]^{(\delta + r_1 + \cdots + r_k)/q[k]}.
$$

Putting $A = A_{k+1}^{\delta + r_1 + \cdots + r_k}$, $B_1 = C_{A,n}[k]^{(\delta + r_1 + \cdots + r_k)/q[k]}$ and applying (19) for $\delta = 1$ and $A \gg B_1$, we have

$$
B_1 \geq A_{1+1}^{-r_{1+1}/2} \left( A_1^{r_1/2} B_1^{1/2} A_1^{r_1/2} \right)^{(1+r)/(p+r)} A_1^{-r_1/2}
$$

holds for $p \geq 1$ and $r \geq 0$.

Putting $r_{k+1} = r(\delta + r_1 + r_2 + \cdots + r_k)$ in (23), then (23) can be rewritten by

$$
B_1 \geq A_{k+1}^{-r_{k+1}/2} \left( A_{k+1}^{r_{k+1}/2} C_{A,n}[k]^{(\delta + r_1 + \cdots + r_k)/q[k]} \right) p
$$

$$
\times A_{k+1}^{r_{k+1}/2} \left( 1+r/(p+r) \right) A_{k+1}^{-r_{k+1}/2}.
$$

Putting $p = (q[k] p_{k+1}) / ((\delta + r_1 + r_2 + \cdots + r_k) \geq 1$, since

$$
p_{k+1} \geq (\delta + r_1 + r_2 + \cdots + r_k)/q[k] \text{ in (16), then we have}
$$

$$
A_{k+1}^{r_{k+1}/2} I_k(p_k, r_k) A_k^{r_k/2}
$$

$$
= B_1 = C_{A,n}[k]^{(\delta + r_1 + \cdots + r_k)/q[k]} \times A_{k+1}^{r_{k+1}/2}
$$

$$
\times \left( A_{k+1}^{r_{k+1}/2} C_{A,n}[k]^{(\delta + r_1 + \cdots + r_k)/q[k]} \right) p A_{k+1}^{r_{k+1}/2} \left( 1+r/(p+r) \right)
$$

$$
\geq A_{k+1}^{-r_{k+1}/2}
$$

$$
\times \left( A_{k+1}^{r_{k+1}/2} C_{A,n}[k]^{(\delta + r_1 + \cdots + r_k)/q[k]} \right) p A_{k+1}^{r_{k+1}/2} \left( 1+r/(p+r) \right)
$$

$$
\times A_{k+1}^{r_{k+1}/2}
$$

$$
= A_{k+1}^{-r_{k+1}/2} C_{A,n}[k + 1]^{(\delta + r_1 + \cdots + r_k)/q[k + 1]} A_{k+1}^{-r_{k+1}/2}
$$

$$
= I_{k+1}(p_{k+1}, r_{k+1}),
$$

and we have (18) for $k$ such that $1 \leq k \leq n$ by (25) and (20) since (20) means (18) for $k = 1$.

Corollary 6. If $A_n \gg A_{n-1} \gg \cdots \gg A_2 \gg A_1 \gg B$ and $r_1, r_2, \ldots, r_n \geq 0$ for a natural number $n$. For any fixed $\delta \geq 0$, let $p_1, p_2, \ldots, p_n$ be satisfied by (16).

Then the following inequalities hold:

$$
B^\delta \geq A_{1+1}^{-r_{1+1}/2} \left( A_1^{r_1/2} B_{1+1}^{r_1/2} A_1^{r_1/2} \right)^{(\delta + r_1)/q[k]} A_1^{-r_1/2}
$$

$$
\geq A_{1+1}^{-r_{1+1}/2} A_{1+1}^{-r_{1+1}/2}
$$

$$
\times \left[ A_{1+1}^{r_{1+1}/2} \left( A_{1+1}^{r_1/2} B_{1+1}^{r_1/2} A_{1+1}^{r_1/2} \right) P_1^{r_1/2} A_2^{r_1/2} \right]^{(\delta + r_1 + \cdots + r_k)/q[k + 1]}
$$

$$
\times A_{1+1}^{-r_{1+1}/2} A_{1+1}^{-r_{1+1}/2}
$$

$$
\vdots
$$

$$
\geq A_{1+1}^{-r_{1+1}/2} A_{1+1}^{-r_{1+1}/2} A_{1+1}^{-r_{1+1}/2} \cdots A_{1+1}^{-r_{1+1}/2} A_{1+1}^{-r_{1+1}/2}
$$

$$
\times C_{A,n}[n]^{(\delta + r_1 + \cdots + r_k)/q[k + 1]}
$$

$$
\times A_{1+1}^{-r_{1+1}/2} A_{1+1}^{-r_{1+1}/2} \cdots A_{1+1}^{-r_{1+1}/2} A_{1+1}^{-r_{1+1}/2},
$$

where $C_{A,n}[n]$, $q[n]$, and $I_k(p_k, r_k)$ $1 \leq k \leq n$ are defined in (2), (4), and (17).
Proof. Applying (18) of Theorem 5 for $k$ such that $1 \leq k \leq n$, we have

$$B^\delta = A^{r/2} I_0(p_0, r_0) A^{r/2} \geq I_1(p_1, r_1) = A_1^{r/2} A_1^{r/2} I_2(p_2, r_2) A_1^{r/2} \geq A_1^{r/2} I_2(p_2, r_2) A_1^{r/2}$$

$$\geq A_1^{r/2} I_2(p_2, r_2) A_1^{r/2} = A_1^{r/2} A_1^{r/2} I_2(p_2, r_2) A_1^{r/2} \geq A_1^{r/2} A_1^{r/2} I_2(p_2, r_2) A_1^{r/2}$$

$$\times A_1^{r/2} A_1^{r/2} = A_1^{r/2} A_1^{r/2}$$

(27)

We can obtain the following inequality from the hypothesis (28) for the case $n = k$:

$$A^n_k \geq C_{A,B}[k]^{r/[q(k)], (30)}$$

hence we have $A_{k+1} \gg A_k \gg C_{A,B}[k]^{1/[q(k)], and (i) of Theorem A ensures}$

$$A_{k+1}^{r/2} \geq \left( A_{k+1}^{r/2} C_{A,B}[k]^{p/q[k]} r/(p+r) \right)^{1/(p+r)}$$

for $p, r > 0$. (31)

Putting $r = r_{k+1}$ and $p = q[k]_{p+1}$, then we have the following inequality:

$$A_{k+1}^{r/2} \geq \left( A_{k+1}^{r/2} C_{A,B}[k]^{p/q[k]} r_{k+1}/(q[k]_{p+1} r_{k+1}) \right)^{1/(p+r)}$$

(32)

so that (32) shows (28) for $k + 1$. □

**Theorem 8.** If $A_n \gg A_{n-1} \gg \cdots \gg A_2 \gg A_1 \gg B$ and $r_1, r_2, \ldots, r_n \geq 0$ for a natural number $n$. For any fixed $\delta \geq 0$, let $p_1, p_2, \ldots, p_n$ be satisfied by (16).

Then

$$I_n(p_n, r_n) = A^{r/2} C_{A,B}[n]^{q/[q(n)], (33)}$$

is a decreasing function of both $r_n \geq 0$ and $p_n$ which satisfies

$$p_n \geq \frac{\delta + r_1 + r_2 + \cdots + r_{n-1}}{q[n-1]}, (34)$$

where $C_{A,B}[n]$ and $q[n]$ are defined in (2) and (4).

**Proof.** Since the condition (16) with $\delta \geq 0$ suffices (28) in Theorem 7, we have the following inequality by Theorem 7; see (28).

We state the following important inequality (35) for the forthcoming discussion which is the inequality in (16):

$$q[n] = q[n-1], p_n + r_n \geq \delta + r_1 + r_2 + \cdots + r_{n-1} + r_n (35)$$

because the inequality in (35) follows by (ii) of Lemma 2, and the inequality follows by

$$q[n-1], p_n \geq \delta + r_1 + r_2 + \cdots + r_{n-1} (36)$$

obtained by (34).

(a) Proof of the result that $I_n(p_n, r_n)$ is a decreasing function of $p_n$.

Without loss of generality, we can assume that $p_n > 0$.

We can obtain the following inequality by (28) and by (i) of Lemma 2:

$$A^n_n \geq C_{A,B}[n]^{r/[q(n)], (37)}$$

holds for any $p_1 \geq 0$ and $r_1 \geq 0$ by (i) of Theorem A, whence

(28) for $n = 1$.

Since $A_1 \gg B$ implies

$$A_1 \geq (A_1^{(r/2) B^n [r/2])^{(r/2) [p+r]}}, (29)$$

(30)

(31)

(32)

(33)

(34)

(35)

(36)

(37)
and (37) implies
\[
(C_{A,B}[n-1]P_{n}^{a/2}A_{n}^{c}C_{A,B}[n-1]P_{n}^{a/2})^{(q[n]-r_{n})/q[n]}
\geq C_{A,B}[n-1]P_{n}^{a}.
\] (38)

Put \( \alpha = \omega/P_{n} \in [0, 1] \) for \( P_{n} \geq \omega \geq 0 \), then we raise each side of (38) to the power \( \alpha = \omega/P_{n} \in [0, 1] \), then
\[
(C_{A,B}[n-1]P_{n}^{a/2}A_{n}^{c}C_{A,B}[n-1]P_{n}^{a/2})^{(q[n]-r_{n})/q[n]P_{n}^{a}}
\geq C_{A,B}[n-1]P_{n}^{a}.
\] (39)

Whence we have
\[
I_{n}(P_{n}, r_{n})
= A_{n}^{-\tau_{n}/2}(A_{n}^{r_{n}/2}C_{A,B}[n-1]P_{n}^{a/2}A_{n}^{r_{n}/2})^{(\delta+r_{1}+r_{2}+\cdots+r_{n})/(q[n]+q[n]P_{n}^{a})}A_{n}^{-\tau_{n}/2}
\times \left\{ (A_{n}^{r_{n}/2}C_{A,B}[n-1]P_{n}^{a/2})^{(q[n]-r_{n})/q[n]P_{n}^{a}}
\times C_{A,B}[n-1]P_{n}^{a/2}A_{n}^{r_{n}/2} \right\}^{(\delta+r_{1}+r_{2}+\cdots+r_{n})/(q[n]+q[n]P_{n}^{a})}
\geq A_{n}^{-\tau_{n}/2}(A_{n}^{r_{n}/2}C_{A,B}[n-1]P_{n}^{a/2}A_{n}^{r_{n}/2})^{(q[n]-r_{n})/(q[n]+q[n]P_{n}^{a})}A_{n}^{-\tau_{n}/2}
\times I_{n}(P_{n}+\omega, r_{n}),
\] (40)

and the last inequality holds by LH because (39) and \((\delta + r_{1} + r_{2} + \cdots + r_{n})/(q[n]-1)(P_{n}+\omega)+r_{n}) \in [0, 1]\] which is ensured by (35) and \(q[n]+q[n]-1)\omega = q[n-1](P_{n}+\omega)+r_{n} \geq q[n]\) by (4), so that \(I_{n}(P_{n}, r_{n})\) is a decreasing function of \(P_{n}\).

(b) Proof of the result that \(I_{n}(P_{n}, r_{n})\) is a decreasing function of \(r_{n}\).

Without loss of generality, we can assume that \(r_{n} > 0\). Raise each side of (28) to the power \(\mu/r_{n} \in [0, 1]\) for \(r_{n} \geq \mu \geq 0\) by LH, then
\[
A_{n}^{\mu} \geq (A_{n}^{r_{n}/2}C_{A,B}[n-1]P_{n}^{a/2}A_{n}^{r_{n}/2})^{\mu/q[n]}.
\] (41)

We state the following inequality by (ii) of Lemma 3 and (35):
\[
q[n] - (\delta + r_{1} + r_{2} + \cdots + r_{n})
= q[n-1]P_{n} + r_{n} - (\delta + r_{1} + r_{2} + \cdots + r_{n})
= q[n-1]P_{n} - (\delta + r_{1} + r_{2} + \cdots + r_{n-1}) \geq 0.
\] (42)

Then we have
\[
I_{n}(P_{n}, r_{n})
= A_{n}^{-\tau_{n}/2}C_{A,B}[n-1]P_{n}^{a/2}A_{n}^{r_{n}/2}
\times \left\{ (A_{n}^{r_{n}/2}C_{A,B}[n-1]P_{n}^{a/2})^{(q[n]-r_{n})/q[n]P_{n}^{a}}
\times C_{A,B}[n-1]P_{n}^{a/2}A_{n}^{r_{n}/2} \right\}^{(\delta+r_{1}+r_{2}+\cdots+r_{n})/(q[n]+q[n]P_{n}^{a})}
\geq A_{n}^{-\tau_{n}/2}(A_{n}^{r_{n}/2}C_{A,B}[n-1]P_{n}^{a/2}A_{n}^{r_{n}/2})^{(q[n]-r_{n})/(q[n]+q[n]P_{n}^{a})}A_{n}^{-\tau_{n}/2}
\times I_{n}(P_{n}+\omega, r_{n}),
\] (43)
\[
\begin{align*}
&\geq C_{A,B}[n-1]^{p/2} \\
&\times \left\{C_{A,B}[n-1]^{p/2} A_{A}^{r_{1}+\mu} \\
&\times C_{A,B}[n-1]^{p/2} \left(\delta + r_{1} + r_{2} + \cdots + r_{n} - q[n]\right)/\left([q[n]+\mu]\right) \\
&\times C_{A,B}[n-1]^{p/2} \right\} \\
&= I_{n}(p_{n}, r_{n} + \mu),
\end{align*}
\]

and the last inequality holds by LH because (41) and

\[
\frac{\delta + r_{1} + r_{2} + \cdots + r_{n} - q[n]}{q[n] + \mu} = -\frac{q[n] - (\delta + r_{1} + r_{2} + \cdots + r_{n})}{q[n] + \mu} \in [-1, 0],
\]

so that \(I_{k}(p_{k}, r_{k})\) is a decreasing function of \(r_{n}\). \(\square\)
