Research Article

Convergence of Solutions of Certain Fourth-Order Nonlinear Differential Equations

B. S. Ogundare and G. E. Okecha

Received 4 September 2006; Revised 14 December 2006; Accepted 29 March 2007

Recommended by Thomas P. Witelski

We give sufficient criteria for the existence of convergence of solutions for a certain class of fourth-order nonlinear differential equations using Lyapunov’s second method. A complete Lyapunov function is employed in this work which makes the results to include and improve some existing results in literature.

1. Introduction

In this paper, we will consider the fourth-order differential equation

\[ x^{(iv)} + ax'' + f(x,\dot{x})\dot{x} + g(\dot{x}) + h(x) = p(t), \]  

where \( a > 0 \), the functions \( f, g, h, p \) are continuous in the respective arguments displayed explicitly, \( \dot{x} = dx/dt, \ddot{x} = d^2x/dt^2, \dot{\ddot{x}} = d^3x/dt^3, \) and \( x^{(iv)} = d^4x/dt^4 \). The conditions on \( f, g, h, \) and \( p \) are such that the existence of solutions of (1.1) corresponding to any preassigned initial solutions is guaranteed.

Solutions of the equation of the form (1.1) have been investigated by several researchers on the account of boundedness, stability, and global asymptotic stability (see, e.g., [1–9]). Some results on these can be found in [10]. Out of the numerous works on this class of equations only a few were devoted to the convergence of the solutions (see, e.g., [11, 12]).

By convergence of solutions we mean, given any two solutions \( x_1(t) \) and \( x_2(t) \) of (1.1), \( x_2(t) - x_1(t) \to 0, x_2(t) - x_1(t) \to 0, \dot{x}_2(t) - \dot{x}_1(t) \to 0, \) and \( \ddot{x}_2(t) - \ddot{x}_1(t) \to 0 \) as \( t \to \infty \).
In [13–16], certain classes of third-order nonlinear differential equations were investigated and their solutions were proved to converge under certain conditions.

In [15], the author considered the equation

\[ \ddot{x} + ax + b\dot{x} + h(x) = p(t,x,\dot{x},\ddot{x}) \]  

(1.2)

and established that the boundedness of both \( p(t) \) and \( \int p(\tau)d\tau \) together with the differentiability of the function \( h \) guaranteed the convergence of the solutions of the considered equation. This result was improved upon in [16] when the stringent conditions placed on the function \( h \) in [15] were dispensed with.

Similarly in [14], the author established that the solutions of the considered equation converged without many restrictions on the nonlinear terms that were involved.

In [11], the author considered (1.1) with \( g(\dot{x}) = cx \) (\( c > 0 \)), and further with the assumption that \( h \) was not necessarily differentiable but satisfied an incrementary ratio \( \eta^{-1}(h(x + \xi) - h(\xi)) \eta \neq 0 \), which lies in a closed subinterval \( I_0 \) of the Routh-Hurwitz interval \((0,(ab-c)c/a^2)\), where \( I_0 \equiv [\Delta_0,k(ab-c)c/a^2] \).

The author in [12] considered (1.1) with \( f(x,\dot{x}) = b \) and criteria for the existence of convergent solutions were established, whereas in [11] he considered (1.1) with \( f(x,\dot{x}) = b \) and \( g(\dot{x}) = c \). The work in [12] extends [11] from equation with one nonlinearity to the one having two nonlinearities which makes it an extension of [11] as well as an extension of [15] to an analogous fourth-order equation.

In all these studies, Lyapunov’s second method has been the main tool of investigation. In the literature, the incomplete Lyapunov functions are frequent and used by a quite appreciable number of researchers due to the nature of construction and simplicity. The works with the complete Lyapunov functions are not as frequent as the ones with incomplete Lyapunov function.

In this present work, we will extend the work in [14] to (1.1). With a suitable complete Lyapunov function and less stringent assumptions on the nonlinear terms \( f, g, h, \) and \( p \), we will show that the solutions of (1.1) converge.

This work is organized in this order, the main result is presented in Section 2 as formulation of results. Section 3 deals with the tools needed to the proof of the main result. The proof of the main theorem is presented is Section 4.

2. Formulation of results

The following is the main result.

**Theorem 2.1.** Suppose that \( x_1(t) \) and \( x_2(t) \) are two solutions of (1.1), suppose further that for arbitrary \( \xi, \eta (\eta \neq 0) \),

(i) \( (h(\xi + \eta) - h(\xi))/\eta \in I_0, \eta \neq 0; \)

(ii) \( (g(\xi + \eta) - g(\xi))/\eta \neq 0; \)

(iii) \( h(0) = g(0) = 0; \)

(iv) \( |f(x,y)| \leq b; \)

(v) \( |p(t)| \leq \Lambda, (\Lambda \text{ constant}) \)

then there exists a positive constant \( K_5 \) such that

(vi) \( S(t_2) \leq S(t_1)e^{-K_5(t_2-t_1)} \) for \( t_2 \geq t_1 \),

Suppose that \( x_1(t) \) and \( x_2(t) \) are two solutions of (1.1), suppose further that for arbitrary \( \xi, \eta (\eta \neq 0) \),
where
\[
S(t) = \left\{ \left[ x_2(t) - x_1(t) \right]^2 + \left[ \dot{x}_2(t) - \dot{x}_1(t) \right]^2 + \left[ \ddot{x}_2(t) - \ddot{x}_1(t) \right]^2 \right\}.
\]

(2.1)

Furthermore, all solutions of (1.1) converge.

We have the following corollaries as the consequences of Theorem 2.1 when \( x_1(t) = 0 \) and \( t_1 = 0 \).

**Corollary 2.2.** Suppose that \( p = 0 \) in (1.1) and suppose further that the conditions of the theorem hold, then the trivial solution of (1.1) is exponentially stable in the large.

**Corollary 2.3.** Suppose also that the conditions of Corollary 2.2 hold for arbitrary \( \eta (\eta \neq 0) \) and \( \xi = 0 \), then there exists a constant \( K_0 \) such that every solution \( x(t) \) of (1.1) satisfies
\[
| x(t) | \leq K_0, \quad | \dot{x}(t) | \leq K_0, \quad | \ddot{x}(t) | \leq K_0, \quad | \dddot{x}_2(t) | \leq K_0.
\]

(2.2)

**Remark 2.4.** The corresponding linear equation to (1.1) given as
\[
x^{(iv)} + a\ddot{x} + b\dot{x} + cx + dx = p(t),
\]
\( d > 0 \) and constants \( b, c \) (with \( h(x) = dx, f(x, \dot{x}) = b, g(\ddot{x}) = cx \)) and \( p(t) = 0 \) in (1.1), is known to have convergent solutions if the Routh-Hurwitz conditions/criteria \( ab - c > 0, \ (ab - c)c - a^2d > 0 \) hold.

**Notations 2.5.** Throughout this paper, \( K_3, K_4, \) and \( K_5 \) will denote finite positive constants whose magnitudes depend only on the constants \( a, b, c, d, \delta, \) and \( \Delta \) but are independent of solutions of (1.1). \( K_i \)'s are not necessarily the same for each time they occur, but each \( K_i, i = 1,2,\ldots,5 \) retains its identity throughout.

### 3. Preliminary results

On setting \( \dot{x} = y, \dot{y} = z, \dot{z} = w \), (1.1) can be replaced by an equivalent system
\[
\begin{align*}
\dot{x} &= y, \quad \dot{y} = z, \quad \dot{z} = w, \\
\dot{w} &= -aw - f(x, y)z - g(y) - h(x) + p(t).
\end{align*}
\]

(3.1)

Following Cartwright [17] and Reissig et al. [10], a possible Lyapunov function is a quadratic function in the variables for which the coefficients are suitably chosen. In this regard, we will assume a Lyapunov function of the form
\[
2V(x, y, z, w) = Ax^2 + By^2 + Cz^2 + Dw^2 + 2Exy + 2Fxz \\
+ 2Ixz + 2Jyz + 2Mzw + 2Nzw.
\]

(3.2)

Our investigation rests mainly on the properties of the function
\[
W(t) \equiv V(x_2(t) - x_1(t), y_2(t) - y_1(t), z_2(t) - z_1(t), w_2(t) - w_1(t))
\]

(3.3)
We will prove the following.

with $V(x(t), y(t), z(t), w(t))$ written as $V(x, y, z, w)$, where

$$A = \frac{a \delta}{\Delta} \left\{ (b + d)(c^2 + d^2) \left[ d(1 - ad) - c \right] + d^3 [a(b^2 + d^2) + L] \right\},$$

$$B = \frac{\delta}{\Delta} \left\{ dL(abd + c) + a(b^2 + d^2) \left[ b(d - c) + cd \right] + [d(1 - ad) - c] \left[ ad(b^2 + c^2) - cd^2(b + 1) + a^2bc \right] \right\},$$

$$C = \frac{\delta}{\Delta} \left\{ a(b^2 + d^2) \left[ d(1 - ad + a^2c + d) - c \right] + d \left[ c(a^2 + b^2) - ab \right] \left[ d(1 - ad) - c \right] + dL(a^2c + d) \right\},$$

$$D = \frac{cd\delta}{\Delta} \left\{ L + ab^2 + (d - c) + ab[(1 - ad) - c] \right\},$$

$$E = \frac{ac\delta}{\Delta} \left\{ d^2L + (b^2 + d^2)(d - c) \right\},$$

$$F = \frac{cd\delta}{bd\Delta} \left\{ d^2L + ab^2d^2(b^2 + d^2) + [b(a^2 + d^2) + d^3][ab^2d^2(d(1 - ad) - c)] \right\},$$

$$I = \frac{abc[d(1 - ad - c)]}{\Delta},$$

$$J = \frac{abcd\delta}{\Delta} \left\{ a(b^2 + d^2) + L \right\},$$

$$M = \frac{a\delta}{\Delta} \left\{ d^2L + bd[d(1 - ad) - c] + (b^2 + d^2)(d - c) \right\},$$

$$N = \frac{acd\delta}{\Delta} \left\{ ab^2 + d - c + L \right\},$$

$$\Delta = abcd[d(1 - ad) - c],$$

$$L = b[ad + c[c(b + 1) - c]],$$

with $a, b, c, d$ positive and $[d(1 - ad) - c] > 0$ were obtained after solving the equations that arose when constructing the Lyapunov function.

Thus, $W$ is equivalent to $V(x, y, z, w)$ with $x, y, z, w$ replaced with $x_2 - x_1, y_2 - y_1, z_2 - z_1,$ and $w_2 - w_1$, respectively.

Now, define $W$ as

$$2W(x_2 - x_1, y_2 - y_1, z_2 - z_1, w_2 - w_1)$$

$$= A(x_2 - x_1)^2 + B(y_2 - y_1)^2 + C(z_2 - z_1)^2 + D(w_2 - w_1)^2$$

$$+ 2E(x_2 - x_1)(y_2 - y_1) + 2F(x_2 - x_1)(z_2 - z_1)$$

$$+ 2I(x_2 - x_1)(w_2 - w_1) + 2J(y_2 - y_1)(z_2 - z_1)$$

$$+ 2M(y_2 - y_1)(w_2 - w_1) + 2N(z_2 - z_1)(w_2 - w_1).$$

We will prove the following.
Lemma 3.1. Suppose \( W \) is defined as in (3.5) and \( W(0,0,0,0) = 0 \), then there exist constants \( K_1 \) and \( K_2 \) such that the inequalities

\[
K_1((x_1 - x_2)^2 + (y_1 - y_2)^2 + (z_1 - z_2)^2 + (w_1 - w_2)^2) \leq W \leq K_2((x_1 - x_2)^2 + (y_1 - y_2)^2 + (z_1 - z_2)^2 + (w_1 - w_2)^2)
\]

(3.6)

hold.

Proof of Lemma 3.1. Clearly, \( W(0,0,0,0) = 0 \).

By rearranging (3.5), we have

\[
2W(x_2 - x_1, y_2 - y_1, z_2 - z_1, w_2 - w_1) = \left( \frac{\delta}{\Delta} \right) \left\{ a[d(1 - ad)] \left\{ b[c(x_2 - x_1) + d(y_2 - y_1) + (w_2 - w_1)]^2 \right. \\
+ d^2[(y_2 - y_1) + b^2d^2(x_2 - x_1)]^2 \\
+ b^2d[(y_2 - y_1) + a^2bd(x_2 - x_1)]^2 \\
+ acd[(z_2 - z_1) + \frac{b^2d^3}{a}(x_2 - x_1)]^2 \\
+ dL \left\{ (z_2 - z_1) + ad(x_2 - x_1) \right\}^2 \\
+ ac^2[(z_2 - z_1) + \frac{1}{a}(w_2 - w_1)]^2 \\
+ c[(y_2 - y_1) + \frac{ad}{c}(w_2 - w_1)]^2 \\
+ ad^2[(x_2 - x_1) + \frac{c}{d}(y_2 - y_1)]^2 \\
+ abd[(y_2 - y_1) + \frac{c}{d}(z_2 - z_1)]^2 \\
+ ad(b^2 + d^2) \left\{ ad^2[(x_2 - x_1) + \frac{c(d - c)}{ad^3}(y_2 - y_1)]^2 \\
+ a^2c[(z_2 - z_1) + \frac{d}{a}(x_2 - x_1)]^2 \\
+ \frac{c}{a(b^2 + d^2)}[(w_2 - w_1) + a(z_2 - z_1)]^2 \\
+ b(d - c) \left\{ (y_2 - y_1) + \frac{(w_2 - w_1)}{b} \right\}^2 \\
+ c[(y_2 - y_1) + ab(z_2 - z_1)]^2 \right\} \\
+ \left\{ [d(1 - ad) - c](ad(c^2 + d^2) + abd^2) - \frac{cd^3}{a}(b^2 + d^2) \\
- b^4cd^3 - a^5b^4d^3 - ab^5d^4 - a^2c^2d^2L \right\} (x_2 - x_1)^2
\]

\[\]
where from which we obtain

\[ 2W(x_2 - x_1, y_2 - y_1, z_2 - z_1, w_2 - w_1) \]

\[ \geq \left( \frac{\delta}{\Delta} \right) \left\{ \frac{\left[ d(1 - ad) - c \right](ad(b^2 + c^2) + cd^2(b + 1) + a^2bc - abd^2)}{d^3} \right\} (y_2 - y_1)^2 \]

\[ + \left\{ ad^2(b^2 + d^2) + d(b^2c - ab)[d(1 - ad) - c] - a^3b^2cd(b^2 + d^2) \right\} (x_2 - x_1)^2 \]

\[ + \left\{ d(1 - ad) - c \right\} \left\{ \frac{ad(b^2 + c^2) - cd^2(b + 1) + a^2bc - abd^2}{c} \right\} - ac^2dL \]

\[ - \frac{c^2(d - c)^2}{d^3} \right\} (y_2 - y_1)^2 \]

\[ + \left\{ ad^2(b^2 + d^2) + d(b^2c - ab)[d(1 - ad) - c] \right\} \left\{ \frac{ab}{b}(b^2 + d^2)(d - c) - \frac{a^2d^3}{c} - cdL \right\} (w_2 - w_1)^2 \]

\[ \geq K_1( (x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2 + (w_2 - w_1)^2 ), \]

where

\[ K_1 = \frac{\delta}{\Delta} \min \left\{ \left| \frac{\left[ d(1 - ad) - c \right](ad(c^2 + d^2) + abd^2) - \frac{cd^3}{a} (b^2 + d^2) - b^4cd^3 - a^2b^4d^3 - ab^6d^4 - a^2c^2d^2L}{d^3} \right|, \right. \]

\[ \left. \left| \frac{\left[ d(1 - ad) - c \right][ad(b^2 + c^2) - cd^2(b + 1) + a^2bc - abd^2]}{c} \right| - ac^2dL - \frac{c^2(d - c)^2}{d^3} \right. \]
From inequalities (3.10) and (3.11), we have
\[
\begin{align*}
|ad^2(b^2 + d^2) + d(b^2c - ab)[d(1 - ad) - c] - a^2b^2cd(b^2 + d^2) \\
- abc^2L - a^2cd[ab^2 + (d - c)]|,
\end{align*}
\]
\[
\begin{align*}
|L - ab[&(d(1 - ad) - c) - \frac{a}{b}(b^2 + d^2)(d - c) - \frac{a^2d^3}{c} - cdL]|.
\end{align*}
\]
(3.9)

Therefore,
\[
2W(x_2 - x_1, y_2 - y_1, z_2 - z_1, w_2 - w_1)
\geq K_1((x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2 + (w_2 - w_1)^2).
\]
(3.10)

By using the Schwartz inequality \(|xy| \leq (1/2)||x^2 + y^2||\) on (3.2), we have
\[
2W(x_2 - x_1, y_2 - y_1, z_2 - z_1, w_2 - w_1)
\leq \left(\frac{\delta}{\Delta}\right) \left\{ [A + E + F + I](x_2 - x_1)^2 + [B + E + J + M](y_2 - y_1)^2 \\
+ [C + F + J + N](z_2 - z_1)^2 + [D + I + M + N](w_2 - w_1)^2 \right\}
\leq K_2((x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2 + (w_2 - w_1)^2),
\]
(3.11)

where
\[
K_2 = \left(\frac{\delta}{\Delta}\right) \max \{[A + E + F + I], [B + E + J + M], [C + F + J + N], [D + I + M + N]\} > 0.
\]
(3.12)

From inequalities (3.10) and (3.11), we have
\[
K_1((x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2 + (w_2 - w_1)^2)
\leq W \leq K_2((x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2 + (w_2 - w_1)^2).
\]
(3.13)

This proves Lemma 3.1.

\[
\]

\noindent \textbf{Lemma 3.2.} Suppose that \((x_1(t), y_1(t), z_1(t), w_1(t))\), and \((x_2(t), y_2(t), z_2(t), w_2(t))\) are any two distinct solutions of system (3.1) such that
\[
H(x_1, x_2) = \frac{h(x_1(t)) - h(x_2(t))}{x_1(t) - x_2(t)} \in I_0, \quad G(y_1, y_2) = \frac{g(y_1(t)) - g(y_2(t))}{y_1(t) - y_2(t)}(t) \neq 0
\]
(3.14)

for all \(t > 0 (0 < t < \infty)\), where \(I_0\) carries its usual meaning as \(I_0 = [\delta, \Delta]\), then the function
\[
W = V(x_1 - x_2, y_1 - y_2, z_1 - z_2, w_1 - w_2)
\]
(3.15)
satisfies
\[ W \leq -K_3 W \] (3.16)
for some \( K_3 > 0 \).

**Proof of Lemma 3.2.** Differentiating \( W \) with respect to \( t \) using system (3.1), we obtain after some simplifications
\[
\dot{W} = \left( \frac{\delta}{\Delta} \right) \left\{ -IH(x_1(t) - x_2(t))(x_1 - x_2) - MG(y_1(t) - y_2(t))(y_1 - y_2) \\
- [Nb - J](z_1 - z_2)^2 - [Da - N](w_1 - w_2)^2 - Ig(y_1(t) - y_2(t))(x_1 - x_2) \\
- Mh(x_1(t) - x_2(t))(y_1 - y_2) - [Ib - E](x_1 - x_2)(z_1 - z_2) \\
- Nh(x_1(t) - x_2(t))(z_1 - z_2) - [Ia - F](x_1 - x_2)(w_1 - w_2) \\
- Dh(x_1(t) - x_2(t))(w_1 - w_2) - [Mb - F - B](y_1 - y_2)(z_1 - z_2) \\
- Ng(y_1(t) - y_2(t))(z_1 - z_2) - [Ma - I - J](y_1 - y_2)(w_1 - w_2) \\
- Dh(y_1(t) - y_2(t))(w_1 - w_2) - [Db + Na - M - C](z_1 - z_2)(w_1 - w_2) \\
+ E(y_1 - y_2)^2 + A(x_1 - x_2)(y_1 - y_2) + p(t)[I(x_1 - x_2) + M(y_1 - y_2) \\
+ N(z_1 - z_2) + D(w_1 - w_2)] \right\}.
\] (3.17)

Using the conditions on \( h(x_1 - x_2) \) and \( g(y_1 - y_2) \), (3.17) becomes
\[
\dot{W} \leq \left( \frac{\delta}{\Delta} \right) \left\{ -IH(x_1, x_2)(x_1 - x_2)^2 - MG(y_1, y_2)(y_1 - y_2)^2 - [Nb - J](z_1 - z_2)^2 \\
- [Da - N](w_1 - w_2)^2 - Iy(y_1, y_2)(x_1 - x_2)(y_1 - y_2) \\
- MH(x_1, x_2)(x_1 - x_2)(y_1 - y_2) - [Ib - E](x_1 - x_2)(z_1 - z_2) \\
- NH(x_1, x_2)(x_1 - x_2)(z_1 - z_2) - Ng(y_1, y_2)(y_1 - y_2)(z_1 - z_2) \\
- [Mb - F - B](y_1 - y_2)(z_1 - z_2) - [Ia - F](x_1 - x_2)(w_1 - w_2) \\
- Dh(x_1, x_2)(x_1 - x_2)(w_1 - w_2) - [Ma - I - J](y_1 - y_2)(w_1 - w_2) \\
- DG(y_1, y_2)(y_1 - y_2)(w_1 - w_2) - [Db + Na - M - C](z_1 - z_2)(w_1 - w_2) \\
+ E(y_1 - y_2)^2 + A(x_1 - x_2)(y_1 - y_2) + p(t)[I(x_1 - x_2) + M(y_1 - y_2) \\
+ N(z_1 - z_2) + D(w_1 - w_2)] \right\}.
\] (3.18)
This can be written as

\[
\dot{W} \leq -\frac{\delta}{\Delta} W, \quad (3.19)
\]

where

\[
W = \{ W_1 + W_2 + W_3 + W_4 + W_5 + W_6 + W_7 + W_8 + W_9 + W_{10} + W_{11} + W_{12} - W_{13} \}, \quad (3.20)
\]

with

\[
W_1 = \alpha_1 H(x_1, x_2) (x_1 - x_2)^2 + \beta_1 MG(y_1, y_2) (y_1 - y_2)^2 + \gamma_1 (z_1 - z_2)^2
+ \eta_1 (w_1 - w_2)^2,
\]

\[
W_2 = \alpha_2 H(x_1, x_2) (x_1 - x_2)^2 + IG(y_1, y_2) (x_1 - x_2) (y_1 - y_2)
+ \beta_2 MG(y_1, y_2) (y_1 - y_2)^2,
\]

\[
W_3 = \alpha_3 H(x_1, x_2) (x_1 - x_2)^2 + MH(x_1, x_2) (x_1 - x_2) (y_1 - y_2)
+ \beta_3 MG(y_1, y_2) (y_1 - y_2)^2,
\]

\[
W_4 = \alpha_4 H(x_1, x_2) (x_1 - x_2)^2 + [Ib - E] (x_1 - x_2) (z_1 - z_2) + \gamma_2 (z_1 - z_2)^2,
\]

\[
W_5 = \alpha_5 H(x_1, x_2) (x_1 - x_2)^2 + NH(x_1, x_2) (x_1 - x_2) (z_1 - z_2) + \gamma_3 (z_1 - z_2)^2,
\]

\[
W_6 = \alpha_6 H(x_1, x_2) (x_1 - x_2)^2 + [Ia - F] (x_1 - x_2) (w_1 - w_2) + \gamma_2 (w_1 - w_2)^2,
\]

\[
W_7 = \alpha_7 H(x_1, x_2) (x_1 - x_2)^2 + DH(x_1, x_2) (x_1 - x_2) (w_1 - w_2) + \gamma_3 (w_1 - w_2)^2,
\]

\[
W_8 = \beta_4 MG(y_1, y_2) (y_1 - y_2)^2 + [Mb - F - B] (y_1 - y_2) (z_1 - z_2) + \gamma_4 (z_1 - z_2)^2,
\]

\[
W_9 = \beta_5 MG(y_1, y_2) (y_1 - y_2)^2 + NG(y_1, y_2) (y_1 - y_2) (z_1 - z_2)
+ \gamma_5 MG(y_1, y_2) (y_1 - y_2)^2,
\]

\[
W_{10} = \beta_6 MG(y_1, y_2) (y_1 - y_2)^2 + [Ma - I - J] (y_1 - y_2) (w_1 - w_2)
+ \gamma_4 (w_1 - w_2)^2,
\]

\[
W_{11} = \beta_7 MG(y_1, y_2) (y_1 - y_2)^2 + DG(y_1, y_2) (y_1 - y_2) (w_1 - w_2) + \gamma_5 (w_1 - w_2)^2,
\]

\[
W_{12} = \gamma_6 (z_1 - z_2)^2 + [Db + Na - M - C] (z_1 - z_2) (w_1 - w_2) + \gamma_6 (w_1 - w_2)^2,
\]

\[
W_{13} = [I(x_1 - x_2) + M(y_1 - y_2) + N(z_1 - z_2) + D(w_1 - w_2)] p(t),
\]

\[
\sum_{i=1}^{7} \alpha_i = 1, \quad \sum_{i=1}^{7} \beta_i = 1, \quad \sum_{i=1}^{6} \gamma_i = 1, \quad \sum_{i=1}^{6} \eta_i = 1,
\]

(3.21)
$W_2, W_3, \ldots, W_{12}$ are quadratic forms in the variables involved. For any quadratic form $AX^2 + BX + C$ to be positive, $B^2 \leq 4AC$. With this property, $W_i$’s, $i = 2, 3, \ldots, 12$, are positive if
\[
\max \left\{ \frac{(Ia - F)^2}{4\alpha_4 \gamma_2}, \frac{(Ib - E)^2}{4\alpha_6 \eta_2} \right\} \leq H \leq \min \left\{ \frac{4\alpha_5 \gamma_3}{N^2}, \frac{4\alpha_7 \eta_3}{D^2} \right\},
\]
(a)
\[
\max \left\{ \frac{(Mb - F - B)^2}{M\beta_4 \gamma_4}, \frac{(Ma - I - J)^2}{4M\beta_6 \gamma_4} \right\} \leq G \leq \min \left\{ \frac{4M\beta_5 \gamma_5}{N^2}, \frac{4M\beta_7 \eta_5}{D^2} \right\}
\]
(b)
(see the appendix for details).

Moreover, with suitable choice of $\delta$ (small enough), we can always have
\[
W_{13} \geq \delta \left\{ (x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2 + (w_2 - w_1)^2 \right\}^{1/2}.
\]
(3.22)
With these conditions, we have that
\[
W \geq W_1,
\]
(3.23)
with $K_3 = \max\{\alpha_1 H(x_1, x_2), \beta_1 MG(y_1, y_2), \gamma_1, \eta_1\}$.

Then from (3.19), we could have a $K_4$ such that
\[
\dot{W} \leq \left( \frac{\delta}{\Delta} \right) \left\{ -K_4 ((x_1 - x_2)^2 + (y_1 - y_2)^2 + (z_1 - z_2)^2 + (w_1 - w_2)^2) \right\}
\]
(3.24)
or
\[
\dot{W} \leq -K_5 W,
\]
(3.25)
with $K_5 = \delta/\Delta K_4$.

This completes the proof of Lemma 3.2. \qed

Since $x_1(t)$ and $x_2(t)$ are solutions to be considered, we want to establish that the two solutions converge. Next is to establish that the solutions $x_1(t)$ and $x_2(t)$ converge.

4. Proof of the main result

We will now give the proof of the main result.

Proof of Theorem 2.1. Indeed from inequality (3.25),
\[
\frac{dW}{dt} \leq -K_5 W.
\]
(4.1)
On integration from $t_1$ to $t_2$, we have that
\[
\ln \left( \frac{W(t_2)}{W(t_1)} \right) \leq -K_5 (t_2 - t_1),
\]
\[
\frac{W(t_2)}{W(t_1)} \leq \exp \left( -K_5 (t_2 - t_1) \right).
\]
(4.2)
Therefore,
\[ W(t_2) \leq W(t_1) \exp(K_5(t_2 - t_1)). \] (4.3)

From inequality (3.23), it follows that
\[ W_1 \leq K_3 S, \] (4.4)
where \( S \) is as defined in Theorem 2.1. From Lemma 3.1, we have that
\[ W(t_1) \leq K_2 ((x_1 - x_2)^2 + (y_1 - y_2)^2 + (z_1 - z_2)^2 + (w_1 - w_2)^2) = K_2 S(t_1), \] (4.5)
\[ W(t_2) \leq K_2 ((x_1 - x_2)^2 + (y_1 - y_2)^2 + (z_1 - z_2)^2 + (w_1 - w_2)^2) = K_2 S(t_2); \]
using this in inequality (4.3), we have
\[ S(t_2) \leq S(t_1) \exp(-K_5(t_2 - t_1)) \] (4.6)
for \( t_2 \geq t_1 \).
As \( t \to \infty \), we have from inequality (4.3) that
\[ \dot{W} \leq 0. \] (4.7)

Also from inequality (4.6),
\[ S(t_2) \to 0 \quad \text{as} \quad t_2 \to \infty. \] (4.8)

This implies that
\[ x_2(t) - x_1(t) \to 0, \quad \dot{x}_2(t) - \dot{x}_1(t) \to 0, \]
\[ \ddot{x}_2(t) - \ddot{x}_1(t) \to 0, \quad \dddot{x}_1(t) - \dddot{x}_2(t) \to 0. \] (4.9)

Hence the proof of Theorem 2.1 is complete. \( \square \)

Appendix

The \( W_i \)'s, \( i = 2,3, \ldots, 12 \), are positive if
\[ \frac{G(y_1,y_2)}{H(x_1,x_2)} \leq \frac{4M\alpha_2\beta_2}{I^2}, \] (A.1)
\[ \frac{H(x_1,x_2)}{G(y_1,y_2)} \leq \frac{4\alpha_3\beta_3}{M}, \] (A.2)
\[ \frac{(Ib - E)^2}{\alpha_4 y_2} \leq H(x_1,x_2), \] (A.3)
\[ H(x_1,x_2) \leq \frac{4\alpha_5 y_3}{N^2}, \] (A.4)
\[ \frac{(Ia - F)^2}{4\alpha_6 \eta_2} \leq H(x_1,x_2), \] (A.5)
\begin{align}
H(x_1, x_2) & \leq \frac{4 \alpha_7 \eta_3}{D^2}, & (A.6) \\
\frac{(Mb - F - B)^2}{M \beta_4 \gamma_4} & \leq G(y_1, y_2), & (A.7) \\
G(y_1, y_2) & \leq \frac{4 M \beta_5 \gamma_5}{N^2}, & (A.8) \\
\frac{(Ma - I - J)^2}{4 M \beta_6 \eta_4} & \leq G(y_1, y_2), & (A.9) \\
G(y_1, y_2) & \leq \frac{4 M \beta_7 \eta_5}{D^2}, & (A.10) \\
(Db + Na - M - C)^2 & \leq 4 \gamma_6 \eta_6, & (A.11)
\end{align}

respectively.
