The confluent hypergeometric function kind 1 distribution with the probability density function (pdf) proportional to \( x^{-1} F_1(\alpha; \beta; -x) \), \( x > 0 \) occurs as the distribution of the ratio of independent gamma and beta variables. In this article, a multivariate generalization of this distribution is defined and derived. Several pertinent properties of this multivariate distribution are discussed that shed some light on the nature of the distribution.

1. Introduction

The multivariate Liouville family of distributions was proposed by Marshall and Olkin [1]. Sivazlian [2] introduced Liouville distributions as generalizations of gamma and Dirichlet distributions. The Dirichlet and Liouville distributions have applications in such diverse fields as Bayesian analysis, modeling of multivariate data, order statistics, limit laws, multivariate analysis, reliability theory, and stochastic processes. These distributions have also been applied in geology, biology, chemistry, forensic science, and statistical genetics. A comprehensive review on applications and theoretical developments of these distributions are given in [1–5].

In this article, we propose a multivariate generalization of the confluent hypergeometric function kind 1 distribution which is a new member of the multivariate Liouville family of distributions.

The random variable \( X \) is said to have a confluent hypergeometric function kind 1 distribution, denoted by \( X \sim \text{CH}(\nu; \alpha, \beta, \text{kind } 1) \), if its probability density function (pdf) is given by Gupta and Nagar [6],

\[
\frac{\Gamma(\alpha)\Gamma(\beta - \nu)}{\Gamma(\nu)\Gamma(\beta)\Gamma(\alpha - \nu)} x^{\nu - 1} F_1(\alpha; \beta; -x), \quad x > 0,
\] (1.1)
where $\beta > \nu > 0$, $\alpha > \nu > 0$, and $^1F_1$ is the confluent hypergeometric function kind 1 (Luke [7]). The confluent hypergeometric function kind 1 distribution occurs as the distribution of the ratio of independent gamma and beta variables. Distributions of the product and ratio of independent beta and gamma variates can be found in [8]. For $\alpha = \beta$, the density (1.1) reduces to a gamma density given by

$$
\frac{1}{\Gamma(\nu)}x^{\nu - 1}\exp(-x), \quad x > 0.
$$

(1.2)

Recently, Nagar and Sepúlveda-Murillo [9] studied several properties and stochastic representations of the confluent hypergeometric function kind 1 distribution.

In this article we define and study multivariate generalization of the confluent hypergeometric function kind 1 distribution. In Section 3, the multivariate generalization of the confluent hypergeometric function kind 1 distribution is defined and derived as the distribution of the quotient of a set of independent gamma variables variable with an independent beta variable. Several properties of this distribution including marginal and conditional distributions, distribution of partial sums and several factorizations are studied in Section 4.

### 2. Some useful definitions

Several definitions and results on special functions and integrals used in this article are given in this section. Throughout this work we will use the Pochhammer symbol $(a)_n$ defined by

$$(a)_n = a(a + 1) \cdots (a + n - 1) = (a)_{n-1}(a + n - 1) \text{ for } n = 1, 2, \ldots, \text{ and } (a)_0 = 1.$$

The generalized hypergeometric function of scalar argument is defined by

$$
\pFq(a_1, \ldots, a_p; b_1, \ldots, b_q; z) = \sum_{k=0}^{\infty} \frac{(a_1)_k \cdots (a_p)_k}{(b_1)_k \cdots (b_q)_k} \frac{z^k}{k!},
$$

(2.1)

where $a_i$, $i = 1, \ldots, p$; $b_j$, $j = 1, \ldots, q$ are complex numbers with suitable restrictions and $z$ is a complex variable. Conditions for the convergence of the series in (2.1) are available in the literature, see Luke [7]. From (2.1) it is easy to see that

$$
\begin{align*}
0F0(z) &= \sum_{k=0}^{\infty} \frac{z^k}{k!} = \exp(z), \\
1F0(a; z) &= \sum_{k=0}^{\infty} \frac{(a)_k}{k!} z^k = (1 - z)^{-a}, \quad |z| < 1, \\
1F1(a; c; z) &= \sum_{k=0}^{\infty} \frac{(a)_k z^k}{(c)_k k!}, \\
2F1(a, b; c; z) &= \sum_{k=0}^{\infty} \frac{(a)_k(b)_k z^k}{(c)_k k!}, \quad |z| < 1.
\end{align*}
$$

(2.2)

Also, under suitable conditions,

$$
\begin{align*}
\int_0^\infty \exp(-\delta z) z^{a-1} \pFq(a_1, \ldots, a_p; b_1, \ldots, b_q; \delta y) dz \\
&= \Gamma(a)\delta^{-a} \pFq(a_1, \ldots, a_p; a; b_1, \ldots, b_q; \delta^{-1} y).
\end{align*}
$$

(2.3)
The integral representations of the confluent hypergeometric function and the Gauss hypergeometric function are given as

\[ _1F_1(a; c; z) = \frac{\Gamma(c)}{\Gamma(a)\Gamma(c-a)} \int_0^1 t^{a-1}(1-t)^{c-a-1} \exp(zt) \, dt \]
\[ \text{Re}(c) > \text{Re}(a) > 0, \tag{2.4} \]

\[ _2F_1(a, b; c; z) = \frac{\Gamma(c)}{\Gamma(a)\Gamma(c-a)} \int_0^1 t^{a-1}(1-t)^{c-a-1}(1-zt)^{-b} \, dt, \]
\[ \text{Re}(c) > \text{Re}(a) > 0, \quad |\arg(1-z)| < \pi, \tag{2.5} \]

respectively. Note that the series expansions for \(_1F_1\) and \(_2F_1\) given in (2.2) can be obtained by expanding \(\exp(zt)\) and \((1-zt)^{-b}\), \(|zt| < 1\), in (2.4) and (2.5) and integrating \(t\). Substituting \(z = 1\) in (2.5) and integrating, we obtain

\[ _2F_1(a, b; c; 1) = \frac{\Gamma(c)\Gamma(c-a-b)}{\Gamma(c-a)\Gamma(c-b)}, \quad \text{Re}(c-a-b) > 0, \quad c \neq -1, -2, \ldots. \tag{2.6} \]

The confluent hypergeometric function \(_1F_1(a; c; z)\) satisfies Kummer’s relation

\[ _1F_1(a; c; -z) = \exp(-z)_1F_1(c-a; c; z). \tag{2.7} \]

The Lauricella hypergeometric function \(F_D^{(m)}\) in \(m\) variables \(z_1, \ldots, z_m\) is defined by

\[ F_D^{(m)}[a, b_1, \ldots, b_m; c_1, \ldots, c_m] = \sum_{j_1, \ldots, j_m = 0}^{\infty} \frac{(a)_{j_1+\cdots+j_m} (b_1)_{j_1} \cdots (b_m)_{j_m} z_1^{j_1} \cdots z_m^{j_m}}{(c)_{j_1+\cdots+j_m} j_1! \cdots j_m!}, \tag{2.8} \]

where \(\max\{|z_1|, \ldots, |z_m|\} < 1\). For \(m = 1\), the Lauricella hypergeometric function reduces to a Gauss hypergeometric function and for \(m = 2\) it slides to an Appell hypergeometric function \(F_1\). Using the result

\[ \frac{(a)_j}{(c)_j} = \frac{\Gamma(c)}{\Gamma(a)\Gamma(c-a)} \int_0^1 t^{a+j-1}(1-t)^{c-a-1} \, dt, \quad \text{Re}(c) > \text{Re}(a) > 0, \tag{2.9} \]

for \(j = 0, 1, 2, \ldots\), and

\[ \sum_{j=0}^{\infty} \frac{(b_i)_j (t z_i)^h}{j!} = _1F_0(b_i; t z_i) = (1 - t z_i)^{-b_i}, \quad |z_i| < 1, \quad i = 1, \ldots, m, \tag{2.10} \]
in (2.8), an integral representation of $F_D^{(m)}$ is given by

$$F_D^{(m)}[a, b_1, \ldots, b_m; c; z_1, \ldots, z_m] = \frac{\Gamma(c)}{\Gamma(a)\Gamma(c-a)} \int_0^1 t^{a-1} (1 - t)^{c-a-1} (1 - z_1 t)^{-b_1} \cdots (1 - z_m t)^{-b_m} \, dt. \quad (2.11)$$

Further, replacing $(1 - z_i t)^{-b_i}$ by its equivalent gamma integral, namely,

$$(1 - z_i t)^{-b_i} = \frac{1}{\Gamma(b_i)} \int_0^\infty \exp[-(1 - z_i t)v_i] v_i^{b_i-1} \, dv_i, \quad \text{Re}(b_i) > 0, \quad (2.12)$$

for $i = 1, \ldots, m$ and integrating out $t$, one obtains

$$\prod_{i=1}^m \Gamma(b_i) F_D^{(m)}[a, b_1, \ldots, b_m; c; z_1, \ldots, z_m] = \int_0^\infty \cdots \int_0^\infty \exp \left(- \sum_{i=1}^m v_i \right) \prod_{i=1}^m v_i^{b_i-1} F_1 \left(a; c; -\sum_{i=1}^m z_i v_i \right) \, dv_1 \cdots dv_m. \quad (2.13)$$

For further results and properties of this function the reader is referred to [10, 11].

Let $f(\cdot)$ be a continuous function and $a_i > 0, \ i = 1, \ldots, n$. The integral

$$D_n(a_1, \ldots, a_n; f) = \int_0^\infty \cdots \int_0^\infty \prod_{i=1}^n x_i^{a_i-1} f \left(\sum_{i=1}^n x_i\right) \prod_{i=1}^n \, dx_i \quad (2.14)$$

is known as Liouville’s integral. Substituting $y_i = x_i / x, \ i = 1, \ldots, n - 1$ and $x = \sum_{i=1}^n x_i$ with the Jacobian $J(x_1, \ldots, x_{n-1}, x_n \rightarrow y_1, \ldots, y_{n-1}, x) = x^{n-1}$, it is easy to see that

$$D_n(a_1, \ldots, a_n; f) = \frac{\prod_{i=1}^n \Gamma(a_i)}{\Gamma(\sum_{i=1}^n a_i)} \int_0^\infty x^{\sum_{i=1}^n a_i - 1} f(x) \, dx. \quad (2.15)$$

### 3. Density function

In this section, we present a multivariate generalization of the hypergeometric function kind 1 distribution and derive it using independent beta and gamma variables.

**Definition 3.1.** The random variables $X_1, \ldots, X_n$ are said to have a multivariate confluent hypergeometric function kind 1 distribution, denoted as $(X_1, \ldots, X_n) \sim \text{CH}(\nu_1, \ldots, \nu_n; \alpha, \beta, \text{ kind 1})$, if their joint pdf is given by

$$C(\nu_1, \ldots, \nu_n; \alpha, \beta) \prod_{i=1}^n x_i^{\nu_i-1} F_1 \left(\alpha; \beta; -\sum_{i=1}^n x_i\right), \quad x_i > 0, \ i = 1, \ldots, n, \quad (3.1)$$

where $C(\nu_1, \ldots, \nu_n; \alpha, \beta)$ is the normalizing constant.
The normalizing constant in (3.1) is given by

\[
{C(v_1,\ldots,v_n;\alpha,\beta)^{-1}} = \int_0^{\infty} \cdots \int_0^{\infty} \prod_{i=1}^{n} x_i^{\nu_i-1} F_1 \left( \alpha; \beta; -\sum_{i=1}^{n} x_i \right) \prod_{i=1}^{n} dx_i
\]

where the last line has been obtained by using Liouville’s integral and (2.7). Now, evaluating the above integral and simplifying the resulting expression using (2.3) and (2.6), we get

\[
{C(v_1,\ldots,v_n;\alpha,\beta)^{-1}} = \frac{\prod_{i=1}^{n} \Gamma(\nu_i) \Gamma(\beta - \sum_{i=1}^{n} \nu_i)}{\Gamma(\sum_{i=1}^{n} \nu_i) \Gamma(\beta - \sum_{i=1}^{n} \nu_i)},
\]

where \(\nu_i > 0, i = 1,\ldots,n, \alpha > \sum_{i=1}^{n} \nu_i, \text{ and } \beta > \sum_{i=1}^{n} \nu_i\). For \(\alpha = \beta\), multivariate confluent hypergeometric function kind 1 density simplifies to the product of \(n\) univariate gamma densities. Several special cases of the density (3.1) can be obtained by specializing \(\alpha\) and \(\beta\) and using results on confluent hypergeometric function. For example, substitution of \(\beta = 2\alpha\) in (3.1) and application of the result

\[
F_1(\alpha; 2\alpha; z) = \frac{\Gamma(a + 1/2) \exp(z/2)}{(z/4)^{a-1/2}} I_{a-1/2} \left( \frac{z}{2} \right),
\]

where \(I_{\delta}\) is the modified Bessel function of the first kind, yield

\[
C(v_1,\ldots,v_n;2\alpha)4^{n-1/2}\Gamma\left(\alpha + \frac{1}{2}\right)\exp\left(-\sum_{i=1}^{n} x_i/2\right)\prod_{i=1}^{n} x_i^{\nu_i-1} \times I_{a-1/2} \left( \frac{\sum_{i=1}^{n} x_i}{2} \right), \quad x_i > 0, \; i = 1,\ldots,n.
\]

It may be noted here that the multivariate confluent hypergeometric function kind 1 distribution belongs to the Liouville family of distributions (Sivazlian [2], Gupta and Song [3]). Because of mathematical tractability of the confluent hypergeometric function and its several special cases, the multivariate confluent hypergeometric function kind 1 distribution enriches the class of multivariate Liouville distributions and may serve as an alternative to many existing distributions belonging to this class. The next theorem derives the multivariate confluent hypergeometric function kind 1 distribution using independent gamma and beta variables. First, we define the gamma, beta type 1 and beta type 2 distributions. These definitions can be found in [12].
Definition 3.2. A random variable $X$ is said to have the gamma distribution with shape parameter $a$, $a > 0$, denoted as $X \sim \text{Ga}(a)$, if its pdf is given by

$$
\frac{\exp(-x)x^{a-1}}{\Gamma(a)}, \quad x > 0.
$$

(3.6)

Definition 3.3. A random variable $X$ is said to have the beta type 1 distribution with parameters $(a, b)$, $a > 0$, $b > 0$, denoted as $X \sim \text{B1}(a, b)$, if its pdf is given by

$$
\frac{\Gamma(a+b)}{\Gamma(a)\Gamma(b)}x^{a-1}(1-x)^{b-1}, \quad 0 < x < 1.
$$

(3.7)

Definition 3.4. A random variable $X$ is said to have the beta type 2 distribution with parameters $(a, b)$, denoted as $X \sim \text{B2}(a, b)$, $a > 0$, $b > 0$, if its pdf is given by

$$
\frac{\Gamma(a+b)}{\Gamma(a)\Gamma(b)}x^{a-1}(1+x)^{-(a+b)}, \quad x > 0.
$$

(3.8)

If $X \sim \text{B1}(a, b)$, then $1 - X \sim \text{B1}(b, a)$, $X/(1-X) \sim \text{B2}(a, b)$, and $(1-X)/X \sim \text{B2}(b, a)$. Further, if $Y \sim \text{B2}(a, b)$, then $1/Y \sim \text{B2}(b, a)$, $Y/(1+Y) \sim \text{B1}(a, b)$, and $1/(1+Y) \sim \text{B1}(b, a)$.

The matrix variate generalizations of gamma, beta type 1, beta type 2 distributions have been defined and studied extensively. For example, see [6].

Theorem 3.5. Let $Y_1, \ldots, Y_n$ and $Z$ be independent, $Y_i \sim \text{Ga}(c_i)$, $i = 1, \ldots, n$, and $Z \sim \text{B1}(a, b)$. Then, $(Y_1/Z, \ldots, Y_n/Z) \sim \text{CH}(c_1, \ldots, c_n; \sum_{i=1}^{n} c_i + b, \sum_{i=1}^{n} c_i + a + b)$, kind 1) with the pdf

$$
\frac{\Gamma(a+b)\Gamma(\sum_{i=1}^{n} c_i + a)}{\prod_{i=1}^{n} \Gamma(c_i)\Gamma(\sum_{i=1}^{n} c_i + a + b)} \prod_{i=1}^{n} x_i^{c_i-1}
\times \; _1F_1\left(\sum_{i=1}^{n} c_i + a; \sum_{i=1}^{n} c_i + a + b; -\sum_{i=1}^{n} x_i\right), \quad x_i > 0, \; i = 1, \ldots, n.
$$

(3.9)

Proof. The joint density of $Y_1, \ldots, Y_n$ and $Z$ is given by

$$
\frac{\Gamma(a+b)}{\prod_{i=1}^{n} \Gamma(c_i)\Gamma(a)} \prod_{i=1}^{n} y_i^{c_i-1} \exp\left(-\sum_{i=1}^{n} y_i\right) z^{a-1}(1-z)^{b-1},
$$

(3.10)

where $0 < z < 1$, $y_i > 0$, $i = 1, \ldots, n$. Transforming $X_i = Y_i/Z$, $i = 1, \ldots, n$ with the Jacobian $J(y_1, \ldots, y_n, z \rightarrow x_1, \ldots, x_n, z) = z^n$ in (3.10) and integrating out $z$, we get the marginal density of $(X_1, \ldots, X_n)$ as

$$
\frac{\Gamma(a+b)}{\prod_{i=1}^{n} \Gamma(c_i)\Gamma(a)} \prod_{i=1}^{n} x_i^{c_i-1} \int_0^1 \exp\left(-z\sum_{i=1}^{n} x_i\right) z^{\sum_{i=1}^{n} c_i + a - 1}(1-z)^{b-1} dz,
$$

(3.11)

where $x_i > 0$, $i = 1, \ldots, n$. Now, evaluation of the above integral using (2.4) yields the desired result.
**Corollary 3.6.** Let \( Y_1, \ldots, Y_n \) and \( Z \) be independent, \( Y_i \sim \text{Ga}(c_i), \ i = 1, \ldots, n \), and \( Z \sim \text{B}(a,b) \). Then

\[
\left( \frac{Y_1}{1-Z}, \ldots, \frac{Y_n}{1-Z} \right) \sim \text{CH} \left( c_1, \ldots, c_n, \sum_{i=1}^{n} c_i + b, \sum_{i=1}^{n} c_i + a + b, \text{kind 1} \right).
\]

(3.12)

**Corollary 3.7.** Let \( Y_1, \ldots, Y_n \) and \( V \) be independent, \( Y_i \sim \text{Ga}(c_i), \ i = 1, \ldots, n \), and \( V \sim \text{B}(a,b) \), then

\[
\left( \frac{(1+V)Y_1}{V}, \ldots, \frac{(1+V)Y_n}{V} \right) \sim \text{CH} \left( c_1, \ldots, c_n, \sum_{i=1}^{n} c_i + a, \sum_{i=1}^{n} c_i + a + b, \text{kind 1} \right),
\]

\[
((1+V)Y_1, \ldots, (1+V)Y_n) \sim \text{CH} \left( c_1, \ldots, c_n, \sum_{i=1}^{n} c_i + b, \sum_{i=1}^{n} c_i + a + b, \text{kind 1} \right).
\]

(3.13)

The Laplace transform of the multivariate confluent hypergeometric function kind 1 density (3.1) is given by

\[
C(v_1, \ldots, v_n; \alpha, \beta) = \int_0^\infty \cdots \int_0^\infty \exp \left( -\sum_{i=1}^{n} s_i x_i \right) \prod_{i=1}^{n} x_i^{\nu_i-1} F_1 \left( \alpha; \beta; \sum_{i=1}^{n} x_i \right) \prod_{i=1}^{n} dx_i,
\]

(3.14)

where \( \text{Re}(s_i) > 0, \ i = 1, \ldots, n \). Now, rewriting \( F_1 \) by applying (2.7) and integrating \( x_1, \ldots, x_m \) using (2.13), the above expression is evaluated as

\[
\Gamma(\alpha) \Gamma(\beta - \sum_{i=1}^{n} v_i) \frac{F^{(n)}}{\Gamma(\beta) \Gamma(\alpha - \sum_{i=1}^{n} v_i)} E \left[ \beta - \alpha, v_1, \ldots, v_n; \beta; \frac{1}{1+s_1}, \ldots, \frac{1}{1+s_n} \right].
\]

(3.15)

The joint moments of \( X_1, \ldots, X_n \) are given by

\[
E(X_1^n \cdots X_n^m) = C(v_1, \ldots, v_n; \alpha, \beta) \int_0^\infty \cdots \int_0^\infty \prod_{i=1}^{n} x_i^{\nu_i+n_i-1} F_1 \left( \alpha; \beta; \sum_{i=1}^{n} x_i \right) \prod_{i=1}^{n} dx_i
\]

\[
= \frac{C(v_1, \ldots, v_n; \alpha, \beta)}{C \left( \sum_{i=1}^{n} v_i; \alpha, \beta \right)} \frac{\prod_{i=1}^{n} \Gamma(v_i + n_i)}{\Gamma \left( \sum_{i=1}^{n} v_i + n_i \right)} E \left[ X^{\sum_{i=1}^{n} n_i} \right],
\]

(3.16)

where \( X \sim \text{CH} \left( \sum_{i=1}^{n} v_i, \alpha, \beta, \text{kind 1} \right) \). Note that if \( X \sim \text{CH}(\nu, \alpha, \beta, \text{kind 1}) \), then from [9], one gets

\[
E(X^h) = \frac{\Gamma(\beta - \nu) \Gamma(\nu + h) \Gamma(\alpha - \nu - h)}{\Gamma(\nu) \Gamma(\alpha - \nu) \Gamma(\beta - \nu - h)},
\]

(3.17)
where $\Re(h + v) > 0$, $\Re(h) < \alpha - v$, and $\Re(h) < \beta - v$. Now, computing $E[X_{1}^{n}]$ using the above result, substituting for $C(v_{1}, \ldots, v_{n}; \alpha, \beta)$ and $C(\sum_{i=1}^{n} v_{i}; \alpha, \beta)$ from (3.3) and simplifying the resulting expression, we obtain

$$E(X_{1}^{n} \cdots X_{n}^{n}) = \Gamma(\beta - \sum_{i=1}^{n} v_{i}) \Gamma(\alpha - \sum_{i=1}^{n} v_{i}) \prod_{i=1}^{n} \Gamma(\nu_{1} + r_{i}),$$

(3.18)

where $\alpha > \sum_{i=1}^{n} (v_{i} + r_{i})$ and $\beta > \sum_{i=1}^{n} (v_{i} + r_{i})$. Substituting appropriately in the above expression and using definitions of variance, covariance, and correlation coefficient, it is straightforward to show that

$$E(X_{j}) = \frac{v_{j}(\beta - \sum_{i=1}^{n} v_{i} - 1)}{\alpha - \sum_{i=1}^{n} v_{i} - 1},$$

$$E(X_{j}^{2}) = \frac{v_{j}(\nu_{j} + 1)(\beta - \sum_{i=1}^{n} v_{i} - 1)(\beta - \sum_{i=1}^{n} v_{i} - 2)(\alpha - \sum_{i=1}^{n} v_{i} - 1)(\alpha - \sum_{i=1}^{n} v_{i} - 2)}{\nu_{j}(\beta - \sum_{i=1}^{n} v_{i} - 1)} - \nu_{j}(\beta - \alpha) + \left(\beta - \sum_{i=1}^{n} v_{i} - 2\right)\left(\alpha - \sum_{i=1}^{n} v_{i} - 1\right),$$

(3.19)

$$\text{Var}(X_{j}) = \frac{v_{j}v_{k}(\beta - \sum_{i=1}^{n} v_{i} - 1)(\beta - \sum_{i=1}^{n} v_{i} - 2)(\alpha - \sum_{i=1}^{n} v_{i} - 1)(\alpha - \sum_{i=1}^{n} v_{i} - 2)}{\nu_{j}(\beta - \alpha)\nu_{k}(\beta - \alpha)\left(1 + \frac{\beta - \sum_{i=1}^{n} v_{i} - 2}{\nu_{j}(\beta - \alpha)}\right)\left(1 + \frac{\beta - \sum_{i=1}^{n} v_{i} - 2}{\nu_{k}(\beta - \alpha)}\right)^{-1/2}},$$

where $j \neq k$, $j, k = 1, \ldots, n$.

4. Properties

In this section we derive marginal and conditional distributions, distribution of partial sums, and several factorizations of the multivariate confluent hypergeometric function kind 1 distribution.

The following theorem shows that if the joint distribution of $X_{1}, \ldots, X_{n}$ is multivariate confluent hypergeometric function kind 1, then the marginal distribution of any subset of $X_{1}, \ldots, X_{n}$ is multivariate confluent hypergeometric function kind 1.

**Theorem 4.1.** Let $(X_{1}, \ldots, X_{n}) \sim \text{CH}(v_{1}, \ldots, v_{n}; \alpha, \beta)$, kind 1. Then, for $1 \leq s \leq n$,

$$(X_{1}, \ldots, X_{s}) \sim \text{CH}\left(v_{s}, \ldots, v_{n}; \alpha - \sum_{i=s+1}^{n} v_{i}, \beta - \sum_{i=s+1}^{n} v_{i}, \text{kind 1}\right).$$

(4.1)
Proof. Replacing $1F_1(\alpha;\beta; -\sum_{i=1}^n x_i)$ in (3.1) by its integral representation and integrating out $x_{s+1}, \ldots, x_n$, the marginal density of $X_{s+1}, \ldots, X_s$ is derived as

$$C(v_1, \ldots, v_n; \alpha, \beta) \cdot \frac{\Gamma(\beta) \prod_{i=s+1}^n \Gamma(v_i)}{\Gamma(\alpha) \Gamma(\beta - \alpha)} \prod_{i=1}^s x_i^{\nu_i-1} \int_{0}^{1} \prod_{i=1}^s t^{\nu_i - 1} (1 - t)^{\beta - \alpha - 1} \exp \left( - t \sum_{i=1}^n x_i \right) dt,$$

(4.2)

where $x_i > 0$, $i = s + 1, \ldots, n$. Now, evaluating the above integral using (2.4) and simplifying the resulting expression, we get the desired result. \hfill \Box

**Corollary 4.2.** If $(X_1, \ldots, X_n) \sim \text{CH}(v_1, \ldots, v_n; \alpha, \beta, \text{kind 1})$, then for any subset of variables $(X_{j_1}, \ldots, X_{j_i})$, it holds that

$$(X_{j_1}, \ldots, X_{j_i}) \sim \text{CH} \left( v_{j_1}, \ldots, v_{j_i}; \alpha + \sum_{k=1}^i v_{j_k} - \sum_{k=1}^n v_{j_k}, \beta + \sum_{k=1}^i v_{j_k} - \sum_{k=1}^n v_{j_k}, \text{kind 1} \right),$$

(4.3)

where $j_1, \ldots, j_i$ are distinct integers with $1 \leq j_1, \ldots, j_i \leq n$, $1 \leq i \leq n$.

**Corollary 4.3.** Let $(X_1, \ldots, X_n) \sim \text{CH}(v_1, \ldots, v_n; \alpha, \beta, \text{kind 1})$. Then, for $k = 1, \ldots, n$, $X_k \sim \text{CH}(v_k, \alpha - \sum_{i=1}^n v_i, \beta - \sum_{i=1}^n v_i, \text{kind 1})$.

Using Theorem 4.1, the conditional density of $(X_{s+1}, \ldots, X_n)$ given $(X_1, \ldots, X_s)$ is obtained as

$$C(v_1, \ldots, v_n; \alpha, \beta) \cdot \frac{\prod_{i=s+1}^n \Gamma(v_i)}{\prod_{i=s+1}^n \Gamma(v_i) \Gamma(\alpha - \sum_{i=s+1}^n v_i, \beta - \sum_{i=s+1}^n v_i)} \cdot 1F_1(\alpha; \beta; -\sum_{i=s+1}^n x_i),$$

(4.4)

where $0 < x_i$, $i = s + 1, \ldots, n$.

Next, in Theorem 4.5, we give the joint distribution of partial sums of random variables distributed jointly as multivariate confluent hypergeometric function kind 1. Since the theorem requires familiarity with the Dirichlet type 1 distribution, we first give its definition (see [13]).

**Definition 4.4.** The random variables $U_1, \ldots, U_n$ are said to have a Dirichlet type 1 distribution with parameters $v_1, \ldots, v_n; v_{n+1}$, denoted by $(U_1, \ldots, U_n) \sim D1(v_1, \ldots, v_n; v_{n+1})$, if their joint pdf is given by

$$\Gamma(\sum_{i=1}^{n+1} v_i) \prod_{i=1}^n \Gamma(v_i) \prod_{i=1}^n \left( 1 - \sum_{i=1}^n u_i \right)^{v_{n+1} - 1} u_i^{v_i - 1}, \quad 0 < u_i, \quad i = 1, \ldots, n, \quad \sum_{i=1}^n u_i < 1,$$

(4.5)

where $v_i > 0$, $i = 1, \ldots, n + 1$.

The Dirichlet type 1 distribution, which is a multivariate generalization of the beta type 1 distribution, has been considered by several authors and is well known in the scientific
literature. By making the transformation \( V_j = U_j / (1 - \sum_{i=1}^{n} U_i), \quad j = 1, \ldots, n, \) in (4.5), the Dirichlet type 2 density, which is a multivariate generalization of beta type 2 density, is obtained as

\[
\frac{\Gamma\left(\sum_{i=1}^{n} v_i\right)}{\prod_{i=1}^{n} \Gamma(v_i)} \prod_{i=1}^{n} u_{i}^{v_{i}-1} \left(1 + \sum_{i=1}^{n} u_{i}\right)^{-\sum_{i=1}^{n} v_{i}}, \quad v_{i} > 0, \quad i = 1, \ldots, n. \quad (4.6)
\]

We will write \( (V_1, \ldots, V_n) \sim D2(v_1, \ldots, v_n; v_{n+1}) \) if the joint density of \( V_1, \ldots, V_n \) is given by (4.6).

Let \( n_1, \ldots, n_{\ell} \) be nonnegative integers such that \( \sum_{i=1}^{\ell} n_i = n \) and define

\[
v_{(i)} = \sum_{j=n_i+1}^{n_i'} v_j, \quad n_0' = 0, \quad n_i' = \sum_{j=1}^{i} n_j, \quad i = 1, \ldots, \ell. \quad (4.7)
\]

**Theorem 4.5.** Let \( (X_1, \ldots, X_n) \sim \text{CH}(v_1, \ldots, v_n; \alpha, \beta, \text{kind 1}) \). Define \( Z_j = X_j / x_{(i)}, \quad j = n_i' + 1, \ldots, n_i' - 1 \) and \( X_{(i)} = \sum_{j=n_i' + 1}^{n_i} X_j, \quad i = 1, \ldots, \ell \). Then,

1. \((X_{(1)}, \ldots, X_{(\ell)}) \text{ and } (Z_{n_{i},-1+1}, \ldots, Z_{n_{i}'-1}), \quad i = 1, \ldots, \ell, \) are independently distributed;
2. \((Z_{n_{i},-1+1}, \ldots, Z_{n_{i}'-1}) \sim D1(v_{n_i'+1}, \ldots, v_{n_i'-1}; v_{n_i'}), \quad i = 1, \ldots, \ell;\)
3. \((X_{(1)}, \ldots, X_{(\ell)}) \sim \text{CH}(v_{(1)}, \ldots, v_{(\ell)}; \alpha, \beta, \text{kind 1})\).

**Proof.** Substituting \( x_{(i)} = \sum_{j=n_i' + 1}^{n_i} x_j \) and \( z_j = x_j / x_{(i)}, \quad j = n_i' + 1, \ldots, n_i' - 1, \quad i = 1, \ldots, \ell \) with the Jacobian

\[
J(x_1, \ldots, x_n) = \prod_{i=1}^{\ell} \prod_{j=n_i'+1}^{n_i} x_j^{n_i'-1}, \quad i = 1, \ldots, \ell.
\]

in the density of \((X_1, \ldots, X_n)\) given by (3.1), we get the joint density of \( Z_{n_{i},-1+1}, \ldots, Z_{n_{i}'-1}, X_{(i)}, \quad i = 1, \ldots, \ell \) as

\[
C(v_1, \ldots, v_n; \alpha, \beta) \prod_{i=1}^{\ell} x_{(i)}^{v_{(i)-1}} F_{1}\left(\alpha, \beta; -\sum_{i=1}^{\ell} x_{(i)}\right) \times \prod_{i=1}^{\ell} \left[\prod_{j=n_i'+1}^{n_i} z_j^{v_{(i)-1}} \left(1 - \sum_{j=n_i'+1}^{n_i} z_j\right)^{v_{(i)-1}}\right],
\]

where \( x_{(i)} > 0, \quad i = 1, \ldots, \ell, \quad z_j > 0, \quad j = n_i'+1, \ldots, n_i'-1, \quad \sum_{j=n_i'+1}^{n_i} z_j < 1, \quad i = 1, \ldots, \ell. \) From the factorization in (4.9), it is easy to see that \((X_{(1)}, \ldots, X_{(\ell)}) \text{ and } (Z_{n_{i},-1+1}, \ldots, Z_{n_{i}'-1}), \quad i = 1, \ldots, \ell, \) are independently distributed. Further \((X_{(1)}, \ldots, X_{(\ell)}) \sim \text{CH}(v_{(1)}, \ldots, v_{(\ell)}; \alpha, \beta, \text{kind 1})\) and \((Z_{n_{i},-1+1}, \ldots, Z_{n_{i}'-1}) \sim D1(v_{n_i'+1}, \ldots, v_{n_i'-1}; v_{n_i'}), \quad i = 1, \ldots, \ell. \)  \(\square\)
Theorem 4.12. Let \((X_1, \ldots, X_n) \sim CH(v_1, \ldots, v_n; \alpha, \beta, \text{ kind 1})\). Define \(Z_i = X_i/Z_n, i = 1, \ldots, n-1, \) and \(Z = \sum_{j=1}^{n} X_j\). Then \((Z_1, \ldots, Z_{n-1})\) and \(Z\) are independent, \((Z_1, \ldots, Z_{n-1}) \sim D1(v_1, \ldots, v_{n-1}; v_n)\) and \(Z \sim CH(\sum_{i=1}^{n} v_i, \alpha, \beta, \text{ kind 1})\).

Corollary 4.7. If \((X_1, \ldots, X_n) \sim CH(v_1, \ldots, v_n; \alpha, \beta, \text{ kind 1})\), then \(\sum_{j=1}^{n} X_j\) and \(\sum_{i=1}^{n} X_i/\sum_{i=1}^{n} X_i\) are independent. Further

\[
\frac{\sum_{i=1}^{n} X_i}{\sum_{i=1}^{n} X_i} \sim B1\left(\sum_{i=1}^{s} v_i, \sum_{i=s+1}^{n} v_i\right), \quad s < n.
\]

(4.10)

Theorem 4.8. Let \((X_1, \ldots, X_n) \sim CH(v_1, \ldots, v_n; \alpha, \beta, \text{ kind 1})\). Define \(W_j = X_j/X_n, j = n^*_i + 1, \ldots, n_i - 1\) and \(X_{(i)} = \sum_{j=n_i+1}^{n} X_j, i = 1, \ldots, \ell\). Then,

(i) \((X_{(1)}, \ldots, X_{(\ell)})\) and \((W_{n_i+1}, \ldots, W_{n_i-1})\), \(i = 1, \ldots, \ell\), are independently distributed;

(ii) \((W_{n_i+1}, \ldots, W_{n_i-1}) \sim D2(v_1, \ldots, v_{n_i-1}; v_n)\), \(i = 1, \ldots, \ell\);

(iii) \((X_{(1)}, \ldots, X_{(\ell)}) \sim CH(v_1, \ldots, v_\ell; \alpha, \beta, \text{ kind 1})\).

Corollary 4.9. Let \((X_1, \ldots, X_n) \sim CH(v_1, \ldots, v_n; \alpha, \beta, \text{ kind 1})\). Define \(W_i = X_i/X_n, i = 1, \ldots, n-1, \) and \(Z = \sum_{j=1}^{n} X_j\). Then \((W_1, \ldots, W_{n-1})\) and \(Z\) are independent, \((W_1, \ldots, W_{n-1}) \sim D2(v_1, \ldots, v_{n-1}; v_n)\) and \(Z \sim CH(\sum_{i=1}^{n} v_i, \alpha, \beta, \text{ kind 1})\).

Corollary 4.10. If \((X_1, \ldots, X_n) \sim CH(v_1, \ldots, v_n; \alpha, \beta, \text{ kind 1})\), then \(\sum_{i=1}^{s} X_i/\sum_{i=s+1}^{n} X_i\) and \(\sum_{i=1}^{n} X_i\) are independent. Further

\[
\frac{\sum_{i=1}^{s} X_i}{\sum_{i=s+1}^{n} X_i} \sim B2\left(\sum_{i=1}^{s} v_i, \sum_{i=s+1}^{n} v_i\right), \quad s < n.
\]

(4.11)

In the following six theorems, we give several factorizations of the multivariate confluent hypergeometric function kind 1 density.

Theorem 4.11. Let \((X_1, \ldots, X_n) \sim CH(v_1, \ldots, v_n; \alpha, \beta, \text{ kind 1})\). Define \(Y_n = \sum_{j=1}^{n} X_j\) and \(Y_i = \sum_{j=1}^{i} X_j/\sum_{j=1}^{i} X_i, i = 1, \ldots, n-1\). Then, \(Y_1, \ldots, Y_n\) are independent, \(Y_i \sim B1(\sum_{j=i}^{n} v_j, v_{i+1}), i = 1, \ldots, n-1, \) and \(Y_n \sim CH(\sum_{i=1}^{n} v_i, \alpha, \beta, \text{ kind 1})\).

Proof. Substituting \(x_1 = y_n \prod_{i=1}^{n-1} y_i, x_2 = y_n (1 - y_1) \prod_{i=1}^{n-3} y_i, \ldots, x_{n-1} = y_n(1 - y_{n-2}) y_{n-1}\) and \(x_n = y_n(1 - y_{n-1})\) with the Jacobian \(f(x_1, \ldots, x_n \rightarrow y_1, \ldots, y_n) = \prod_{i=2}^{n} y_i^{-1}\) in (3.1), we get the desired result. \(\square\)

Theorem 4.12. Let \((X_1, \ldots, X_n) \sim CH(v_1, \ldots, v_n; \alpha, \beta, \text{ kind 1})\). Define \(Z_n = \sum_{j=1}^{n} X_j\) and \(Z_i = X_i/\sum_{j=1}^{i} X_j, i = 1, \ldots, n-1\). Then \(Z_1, \ldots, Z_n\) are independent, \(Z_i \sim B2(v_{i+1}, \sum_{j=1}^{i} v_j), i = 1, \ldots, n-1, \) and \(Z_n \sim CH(\sum_{i=1}^{n} v_i, \alpha, \beta, \text{ kind 1})\).
Proof. The desired result follows from Theorem 4.11 by noting that \((1 - Y_i)/Y_i \sim B2(\nu_{i+1}, \Sigma_{j=1}^i v_j)\).

\begin{align*}
\text{Theorem 4.13.} \quad & \text{Let } (X_1, \ldots, X_n) \sim \text{CH}(\nu_1, \ldots, \nu_n; \alpha, \beta, \text{ kind 1}). \text{ Define } W_n = \sum_{j=1}^n X_j \text{ and } W_i = \sum_{j=i+1}^n X_j / X_{i+1}, \text{ } i = 1, \ldots, n - 1. \text{ Then } W_1, \ldots, W_n \text{ are independent, } W_i \sim B2(\sum_{j=1}^i v_j, v_{i+1}), \text{ } i = 1, \ldots, n - 1, \text{ and } W_n \sim \text{CH}(\sum_{i=1}^n v_i, \alpha, \beta, \text{ kind 1}).
\end{align*}

Proof. The result follows from Theorem 4.12 by noting that \(1/Z_i \sim B2(\Sigma_{j=1}^i v_j, v_{i+1}).\)

\begin{align*}
\text{Theorem 4.14.} \quad & \text{Let } (X_1, \ldots, X_n) \sim \text{CH}(\nu_1, \ldots, \nu_n; \alpha, \beta, \text{ kind 1}). \text{ Define } Y_n = \sum_{i=1}^n X_i \text{ and } Y_i = X_i / \sum_{j=1}^i X_j, \text{ } i = 1, \ldots, n - 1. \text{ Then } Y_1, \ldots, Y_n \text{ are independent, } Y_i \sim B1(\nu_i, \sum_{j=i+1}^n v_j), \text{ } i = 1, \ldots, n - 1, \text{ and } Y_n \sim \text{CH}(\sum_{i=1}^n v_i, \alpha, \beta, \text{ kind 1}).
\end{align*}

Proof. Substituting \(x_1 = y_n y_1, \ x_2 = y_n y_2(1-y_1), \ldots, x_{n-1} = y_n y_{n-1}(1-y_1) \cdots (1-y_{n-2}), \) and \(x_n = y_n(1-y_1) \cdots (1-y_{n-1})\) with the Jacobian \(J(x_1, \ldots, x_n \rightarrow y_1, \ldots, y_n) = y_n^{-1} \prod_{i=2}^n (1-y_i)^{-1} \) in (3.1), we get the desired result.

\begin{align*}
\text{Theorem 4.15.} \quad & \text{Let } (X_1, \ldots, X_n) \sim \text{CH}(\nu_1, \ldots, \nu_n; \alpha, \beta, \text{ kind 1}). \text{ Define } Z_n = \sum_{i=1}^n X_i \text{ and } Z_i = X_i / \sum_{j=i+1}^n X_j, \text{ } i = 1, \ldots, n - 1. \text{ Then } Z_1, \ldots, Z_n \text{ are independent, } Z_i \sim B2(\nu_i, \sum_{j=i+1}^n v_j), \text{ } i = 1, \ldots, n - 1, \text{ and } Z_n \sim \text{CH}(\sum_{i=1}^n v_i, \alpha, \beta, \text{ kind 1}).
\end{align*}

Proof. The result follows from Theorem 4.14 by noting that \(Y_i / (1 - Y_i) \sim B2(\nu_i, \sum_{j=i+1}^n v_j).\)

\begin{align*}
\text{Theorem 4.16.} \quad & \text{Let } (X_1, \ldots, X_n) \sim \text{CH}(\nu_1, \ldots, \nu_n; \alpha, \beta, \text{ kind 1}). \text{ Define } W_n = \sum_{i=1}^n X_i \text{ and } W_i = \sum_{j=i}^n X_j / X_i, \text{ } i = 1, \ldots, n - 1. \text{ Then } W_1, \ldots, W_n \text{ are independent, } W_i \sim B2(\sum_{j=i+1}^n v_j, v_i), \text{ } i = 1, \ldots, n - 1, \text{ and } W_n \sim \text{CH}(\sum_{i=1}^n v_i, \alpha, \beta, \text{ kind 1}).
\end{align*}

Proof. The result follows from Theorem 4.15 by noting that \(1/W_i \sim B2(\sum_{j=i+1}^n v_j, v_i).\)

Now, we consider an approximation of the multivariate confluent hypergeometric function kind 1 distribution when \(\beta\) increases.

\begin{align*}
\text{Theorem 4.17.} \quad & \text{If } (X_1, \ldots, X_n) \sim \text{CH}(\nu_1, \ldots, \nu_n; \alpha, \beta, \text{ kind 1}), \text{ then }
\left( \frac{X_1}{\beta}, \ldots, \frac{X_n}{\beta} \right) \overset{d}{\rightarrow} (W_1, \ldots, W_n),
\end{align*}

where \((W_1, \ldots, W_n) \sim D2(\nu_1, \ldots, \nu_n; \alpha - \sum_{i=1}^n v_i),\) and \(\overset{d}{\rightarrow}\) denotes the convergence in distribution.

Proof. Substituting \(x_i = \beta u_i, \text{ } i = 1, \ldots, n\) with the Jacobian \(J(x_1, \ldots, x_n \rightarrow u_1, \ldots, u_n) = \beta^n\) in (3.1), the joint p.d.f. of \(U_1, \ldots, U_n\) is given by

\begin{align*}
g(u_1, \ldots, u_n) = \frac{\Gamma(\alpha)}{\Gamma(\alpha - \sum_{i=1}^n v_i)} \left( \prod_{i=1}^n u_i^{v_i-1} \right) \Gamma(\beta) \beta^\beta \sum_{i=1}^n v_i F_1 \left( \alpha; \beta; -\beta \sum_{i=1}^n u_i \right). \quad (4.13)
\end{align*}
Now, using the results
\[
\lim_{\beta \to \infty} F_1(\alpha; \beta; -\beta \sum_{i=1}^{n} u_i) = F_0(\alpha; -\sum_{i=1}^{n} u_i) = \left(1 + \sum_{i=1}^{n} u_i\right)^{-\alpha},
\]
(4.14)
\[
\lim_{\beta \to \infty} \frac{\Gamma(\beta - \sum_{i=1}^{n} \nu_i)}{\Gamma(\beta) \beta^{-\sum_{i=1}^{n} \nu_i}} = 1
\]
it is easy to see that
\[
\lim_{\beta \to \infty} F(u_1, \ldots, u_n) = G(u_1, \ldots, u_n),
\]
(4.15)
where \(F(u_1, \ldots, u_n)\) is the joint cumulative distribution function (cdf) of \((X_1, \ldots, X_n)/\beta\) and \(G(u_1, \ldots, u_n)\) is the joint cdf of Dirichlet type 2 variables with parameters \((\nu_1, \ldots, \nu_n; \alpha - \sum_{i=1}^{n} \nu_i)\).
