We investigate the solution of a repairable parallel system with primary as well as secondary failures. By using the method of functional analysis, especially, the spectral theory of linear operators and the theory of $C_0$-semigroups, we prove well-posedness of the system and the existence of positive solution of the system. And then we show that the time-dependent solution strongly converges to steady-state solution, thus we obtain the asymptotic stability of the time-dependent solution.

1. Introduction

As science and technology develop, the theory of reliability has infiltrated into the basic sciences, technological sciences, applied sciences, and management sciences. It is well known that repairable parallel systems are the most essential and important systems in reliability theory. In practical applications, repairable parallel systems consisting of three units are often used. Since the strong practical background of such systems, many researchers have studied them extensively under varying assumptions on the failures and repairs; see [1–5] and their references.

The mathematical model of a repairable parallel system with primary as well as secondary failures was first put forward by Gupta; see [1]. This system is consisted of three independent identical units, which are connected in parallel. In the system, one of those units operates, the other two act as warm standby. If the operating unit fails, a warm standby unit is instantaneously switched into operation. The operating unit submits primary failures and secondary failures. The primary failures are the result of a deficiency in a unit while it is operating within the design limits. The secondary failures are the result of causes that stem from a unit operating in a conditions that are outside its design limits. Two important types
of secondary failures are common cause failures and human error failures. A common cause failure refers to the situation where multiple units fail due to a single cause such as fire, earthquake, flood, explosion, design flaw, and poor maintenance; see [2, 3]. A human error failure implies a failure of the system due to a mistake made by a human caused by such reasons as inadequate training, improper tools, and working in a poor lighting environment; see [4, 5]. There is one repairman available to repair these units. Once repaired, these units are as good as new. The failure rates of units and system are constant and independent. When the system is operating, the repairman can repair only one unit at a time. If all units fail, the entire system is repaired and checked before beginning further operation of these units. Unlike [4, 5], the repair times in this system are arbitrarily distributed.

The parallel repairable system with primary and secondary failures can be described by the following equations (see [1]):

\[
\begin{align*}
\frac{dp_0(t)}{dt} &= -(\lambda + 2\alpha + \lambda_{c_0} + \lambda_{h_0})p_0(t) + \mu p_1(t) + \sum_{i=3}^{5} \int_0^\infty \mu_i(x)p_i(x,t)dx , \\
\frac{dp_1(t)}{dt} &= (\lambda + 2\alpha)p_0(t) - (\mu + \lambda + \alpha + \lambda_{c_1} + \lambda_{h_1})p_1(t) + \mu p_2(t), \\
\frac{dp_2(t)}{dt} &= (\lambda + \alpha)p_1(t) - (\mu + \lambda + \alpha + \lambda_{c_2} + \lambda_{h_2})p_2(t), \\
\frac{\partial p_i(x,t)}{\partial t} + \frac{\partial p_i(x,t)}{\partial x} &= -\mu_i(x)p_i(x,t), \quad i = 3, 4, 5. 
\end{align*}
\]

For \( x = 0 \), the boundary conditions

\[
\begin{align*}
p_3(0,t) &= \lambda p_2(t), \\
p_4(0,t) &= \sum_{i=0}^{2} \lambda_{c_i} p_i(t) , \\
p_5(0,t) &= \sum_{i=0}^{2} \lambda_{h_i} p_i(t) 
\end{align*}
\]

are prescribed, and we consider the usual initial condition

\[
\begin{align*}
p_0(0) &= c \in \mathbb{C}, \\
p_i(0) &= b_i \in \mathbb{C}, \quad i = 1, 2, \\
p_j(x,0) &= f_j(x), \quad j = 3, 4, 5, 
\end{align*}
\]

where \( f_j(x) \in L^1[0, \infty) \). The most interesting initial condition is

\[
\begin{align*}
p_0(0) &= 1, \\
p_i(0) &= 0, \quad i = 1, 2, \\
p_j(x,0) &= 0, \quad j = 3, 4, 5. 
\end{align*}
\]
Here \((x, t) \in [0, \infty) \times [0, \infty); p_i(t)\) represents the probability that the system is in state \(i\) at time \(t\), \(i = 0, 1, 2; p_j(x, t)\) represents the probability that at time \(t\) the failed system is in state \(j\) and has an elapsed repair time of \(x\), \(j = 3, 4, 5; \lambda\) represents failure rate of an operating unit; \(\lambda_c\) represents common-cause failure rates from state \(i\) to state \(4\), \(i = 0, 1, 2; \lambda_h\) represents human-error rates from state \(i\) to state \(5\), \(i = 0, 1, 2; \alpha\) represents failure rate of standby unit; \(\mu\) represents constant repair rate if the system is operating; \(\mu_j(x)\) represents repair-rate when the failed system is in state \(j\) and has an elapsed repair time of \(x\) for \(j = 3, 4, 5\) which satisfies \(\mu_j(x) \geq 0\) \((j = 3, 4, 5)\); \(\lambda_c\) \((i = 0, 1, 2)\), \(\lambda_h\) \((i = 0, 1, 2)\), \(\lambda\), \(\mu\), and \(\alpha\) are positive constants.

In [1] the author analyzed the system using supplementary variable technique and obtained various expressions including the system availability, reliability, and mean time of the failure using the Laplace transform. And then he discovered that the time-dependent availability decreases as time increases for exponential repair-time distribution under the following hypotheses.

**Hypothesis 1.** The system has a unique positive time-dependent solution \(p(x, t)\).

**Hypothesis 2.** The time-dependent solution \(p(x, t)\) converges to the steady-state solution \(p(x)\) as time tends to infinity, where

\[
p(x, t) = (p_0(t), p_1(t), p_2(t), p_3(x, t), p_4(x, t), p_5(x, t)),
p(x) = (p_0, p_1, p_2, p_3(x), p_4(x), p_5(x)).
\]

(1.1)

The availability and the reliability depend on the time-dependent solution of the system. In fact, the author used the time-dependent solution in calculating the availability and the reliability. But the author did not discuss the existence of the time-dependent solution and its asymptotic stability, that is, the author did not prove the correctness of the above hypotheses. It is well known that the above hypotheses do not always hold and it is necessary to prove the correctness. Motivated by this, we will show the well-posedness of the system and study the asymptotic stability of the time-dependent solution in this paper, by using the theory of strongly continuous operator semigroups, from [6–8]. First, we convert the model of the system into an abstract Cauchy problem in a Banach space. Next, we show that the operator corresponding to this model generates a positive contraction \(C_0\)-semigroup. Furthermore, we prove that the system is well-posed and there is a positive solution for given initial value. Finally, we prove that the time-dependent solution converging to its static solution in the sense of the norm through studying the spectrum of the operator and irreducibility of the corresponding semigroup, thus we obtain the asymptotic stability of the time-dependent solution of this system.

In this paper, we require the following assumption for the failure rate \(\mu_j(x)\).

**Assumption 1.1** (general assumption). The function \(\mu_j : \mathbb{R}_+ \to \mathbb{R}_+\) is measurable and bounded such that \(\lim_{x \to \infty} \mu_j(x)\) exists and

\[
\mu_j^{(j)} := \lim_{x \to \infty} \mu_j(x) > 0, \quad j = 3, 4, 5, \quad \mu_\infty := \min\left(\mu_\infty^{(3)}, \mu_\infty^{(4)}, \mu_\infty^{(5)}\right).
\]

(1.2)
2. The Problem as an Abstract Cauchy Problem

In this section, we rewrite the underlying problem as an abstract Cauchy problem on a suitable space \( X \), see [6, Definition II.6.1], also see [7, Definition II.6.1]. As the state space for our problem we choose

\[
X := \mathbb{C}^3 \times (L^1[0, \infty))^3.
\]  

(2.1)

It is obvious that \( X \) is a Banach space endowed with the norm

\[
\|p\| := \sum_{i=0}^2 |p_i| + \sum_{n=3}^5 \|p_n\|_{L^1[0, \infty)},
\]

(2.2)

where \( p = (p_0, p_1, p_2, p_3(x), p_4(x), p_5(x))^t \in X \).

For simplicity, let

\[
a_0 := \lambda + 2\alpha + \lambda c_0 + \lambda h_0,
\]

\[
a_1 := \mu + \lambda + \alpha + \lambda c_1 + \lambda h_1,
\]

\[
a_2 := \mu + \lambda + \lambda c_2 + \lambda h_2,
\]

(2.3)

and we denote by \( \psi_j \) the linear functionals

\[
\psi_j : L^1[0, \infty) \rightarrow \mathbb{C}, \quad f \mapsto \psi_j(f) := \int_0^\infty \mu_j(x)f(x)dx, \quad j = 3, 4, 5.
\]

(2.4)

Moreover, we define the operators \( D_j \) on \( W^{1,1}[0, \infty) \) as

\[
D_j f := -\frac{d}{dx}f - \mu_j f, \quad f \in W^{1,1}[0, \infty), \quad j = 3, 4, 5,
\]

(2.5)

respectively. To define the appropriate operator \((A, D(A))\) we introduce a “maximal operator” \((A_m, D(A_m))\) on \( X \) given as

\[
A_m := \begin{pmatrix}
-a_0 & \mu & 0 & \psi_3 & \psi_4 & \psi_5 \\
\lambda + 2\alpha & -a_1 & \mu & 0 & 0 & 0 \\
0 & \lambda + \alpha & -a_2 & 0 & 0 & 0 \\
0 & 0 & 0 & D_3 & 0 & 0 \\
0 & 0 & 0 & 0 & D_4 & 0 \\
0 & 0 & 0 & 0 & 0 & D_5 \\
\end{pmatrix},
\]

(2.6)

\[
D(A_m) := \mathbb{C}^3 \times (W^{1,1}[0, \infty))^3.
\]
To model the boundary conditions (BC) we use an abstract approach as in, for example, [9]. For this purpose we consider the “boundary space”

$$\partial X := \mathbb{C}^3,$$

and then define “boundary operators” $L$ and $\Phi$. As the operator $L$ we take

$$L : D(A_m) \rightarrow \partial X,$$

$$L : \begin{pmatrix} p_0 \\ p_1 \\ p_2 \\ p_3(x) \\ p_4(x) \\ p_5(x) \end{pmatrix} \rightarrow \begin{pmatrix} p_0 \\ p_1 \\ p_2 \\ p_3(x) \\ p_4(x) \\ p_5(x) \end{pmatrix},$$

and the operator $\Phi \in \mathcal{L}(D(A_m), \partial X)$ is given by

$$\Phi p := \begin{pmatrix} 0 & 0 & \lambda & 0 & 0 & 0 \\ \lambda c_0 & \lambda c_1 & \lambda c_2 & 0 & 0 & 0 \\ \lambda b_0 & \lambda b_1 & \lambda b_2 & 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} p_0 \\ p_1 \\ p_2 \\ p_3(x) \\ p_4(x) \\ p_5(x) \end{pmatrix},$$

where $p = (p_0, p_1, p_2, p_3(x), p_4(x), p_5(x))^t \in D(A_m)$.

The operator $(A, D(A))$ on $X$ corresponding to our original problem is then defined as

$$Ap := A_m p, \quad D(A) := \{ p \in D(A_m) \mid Lp = \Phi p \}. \quad (2.10)$$

Let $p_j(0) = p_j(0, t), j = 3, 4, 5, t \geq 0$, then the condition $Lp = \Phi p$ in $D(A)$ is equivalent to (BC).

The system of integrodifferential equations (R) can be written as the following equation:

$$\begin{pmatrix} \frac{dp_0(t)}{dt} \\ \frac{dp_1(t)}{dt} \\ \frac{dp_2(t)}{dt} \\ \frac{dp_3(x,t)}{dt} \\ \frac{dp_4(x,t)}{dt} \\ \frac{dp_5(x,t)}{dt} \end{pmatrix} = \begin{pmatrix} -a_0 & \mu & 0 & q_3 & q_4 & q_5 \\ \lambda + 2\alpha & -a_1 & \mu & 0 & 0 & 0 \\ 0 & \lambda + \alpha & -a_2 & 0 & 0 & 0 \\ 0 & 0 & 0 & D_3 & 0 & 0 \\ 0 & 0 & 0 & 0 & D_4 & 0 \\ 0 & 0 & 0 & 0 & 0 & D_5 \end{pmatrix} \begin{pmatrix} p_0(t) \\ p_1(t) \\ p_2(t) \\ p_3(x,t) \\ p_4(x,t) \\ p_5(x,t) \end{pmatrix}, \quad (2.11)$$
Let \( p(t) = (p_0(t), p_1(t), p_2(t), p_3(t), p_4(t), p_5(t))^t \in X \), then (2.11) is equivalent to the following operator equation:

\[
\frac{dp(t)}{dt} = Ap(t), \quad t \in [0, \infty).
\]  

Thus, the above equations (R), (BC), and (IC) can be equivalently formulated as the abstract Cauchy problem

\[
\frac{dp(t)}{dt} = Ap(t), \quad t \in [0, \infty),
\]

\[p(0) = (c, b_1, b_2, f_1, f_2, f_3)^t \in X.\]

If \( A \) is the generator of a strongly continuous semigroup \((T(t))_{t \geq 0}\) and the initial value in (IC) satisfies \( p(0) = (c, b_1, b_2, f_1, f_2, f_3)^t \in D(A) \), then the unique solution of (R), (BC), and (IC) is given by

\[
p_i(t) = (T(t)p(0))_{i\in\mathbb{N}}, \quad 0 \leq i \leq 2,
\]

\[p_j(x, t) = (T(t)p(0))_{j\in\mathbb{N}}(x), \quad 3 \leq j \leq 5.
\]  

For this reason it suffices to study (ACP).

3. Boundary Spectrum

In this section we investigate the boundary spectrum \( \sigma(A) \cap i\mathbb{R} \) of \( A \). In order to characterise \( \sigma(A) \) by the spectrum of a scalar \( 3 \times 3 \)-matrix, that is, or on the boundary space \( \partial X \), we apply techniques and results from [10]. We start from the operator \((A_0, D(A_0))\) defined by

\[
D(A_0) := \{ p \in D(A_m)Lp = 0 \},
\]

\[A_0 p := A_m p\]  

We give the the representation of the resolvent of the operator \( A_0 \) needed below to prove the irreducibility of the semigroup generated by the operator \( A \).

Lemma 3.1. Let

\[
\Lambda := \begin{pmatrix}
-a_0 & \mu & 0 \\
\lambda + 2\alpha & -a_1 & \mu \\
0 & \lambda + \alpha & -a_2
\end{pmatrix}
\]  

and set \( S := \{ \gamma \in \mathbb{C} \mid \Re \gamma > -\mu \infty \} \setminus \sigma(\Lambda) \). Then one has

\[
S \subseteq \rho(A_0).
\]
Moreover, if \( \gamma \in S \), then

\[
R(\gamma, A_0) = \begin{pmatrix}
\gamma_{1,1} & \gamma_{1,2} & \gamma_{1,3} & \gamma_{1,4} & \gamma_{1,5} & \gamma_{1,6} \\
\gamma_{2,1} & \gamma_{2,2} & \gamma_{2,3} & \gamma_{2,4} & \gamma_{2,5} & \gamma_{2,6} \\
\gamma_{3,1} & \gamma_{3,2} & \gamma_{3,3} & \gamma_{3,4} & \gamma_{3,5} & \gamma_{3,6} \\
0 & 0 & 0 & \gamma_{4,4} & 0 & 0 \\
0 & 0 & 0 & 0 & \gamma_{5,5} & 0 \\
0 & 0 & 0 & 0 & 0 & \gamma_{6,6}
\end{pmatrix},
\]

(3.4)

where

\[
gr_{1,1} = \frac{(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)},
\]

\[
gr_{1,2} = \frac{\mu(\gamma + a_2)}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)},
\]

\[
gr_{1,3} = \frac{\mu^2}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)},
\]

\[
gr_{1,4} = \frac{\mu(\gamma + a_2)\psi_4 R(\gamma, D_4)}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)},
\]

\[
gr_{1,5} = \frac{\mu(\gamma + a_2)\psi_4 R(\gamma, D_4)}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)},
\]

\[
gr_{1,6} = \frac{\mu^2\psi_5 R(\gamma, D_5)}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)},
\]

\[
gr_{2,1} = \frac{(\lambda + 2\alpha)(\gamma + a_2)}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)},
\]

\[
gr_{2,2} = \frac{(\gamma + a_0)(\gamma + a_2)}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)},
\]

\[
gr_{2,3} = \frac{\mu(\gamma + a_0)}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)},
\]

\[
gr_{2,4} = \frac{(\lambda + 2\alpha)(\gamma + a_2)\psi_3 R(\gamma, D_3)}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)},
\]

\[
gr_{2,5} = \frac{(\lambda + a_0)(\gamma + a_2)\psi_4 R(\gamma, D_4)}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)},
\]

\[
gr_{2,6} = \frac{\mu(\gamma + a_0)\psi_5 R(\gamma, D_5)}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)},
\]
The imaginary axis belongs to the resolvent set of $A_0$.

\[ r_{3,1} = \frac{\lambda + 2\alpha}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)}, \]

\[ r_{3,2} = \frac{\gamma + a_0}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)}, \]

\[ r_{3,3} = \frac{(\lambda + 2\alpha)(\gamma + a_0)}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)}, \]

\[ r_{3,4} = \frac{(\lambda + 2\alpha)(\gamma + a_0)}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)}, \]

\[ r_{3,5} = \frac{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)}{(\gamma + a_0)(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)(\gamma + a_0) - \mu(\lambda + 2\alpha)(\gamma + a_2)}, \]

\[ r_{3,6} = R(\gamma, D_3), \]

\[ r_{4,4} = R(\gamma, D_3), \]

\[ r_{5,5} = R(\gamma, D_4), \]

\[ r_{6,6} = R(\gamma, D_3). \]

(3.5)

The resolvent operators of the differential operators $D_j$ ($j = 3, 4, 5$) are given by

\[ (R(\gamma, D_j)p)(x) = e^{-\gamma x} \int_0^x e^{\gamma s} \mu_1(\xi) d\xi p(s) ds \]

for $p \in L^1[0, \infty)$.

Proof. A combination of [11, Proposition 2.1] and [12, Theorem 2.4] yields that the resolvent set of $A_0$ satisfies

\[ \rho(A_0) \supseteq \mathbb{S}. \]

(3.7)

For $\gamma \in \mathbb{S}$ we can compute the resolvent of $A_0$ explicitly applying the formula for the inverse of operator matrices; see [12, Theorem 2.4]. This leads to the representation (3.4) of the resolvent of $A_0$.

Clearly, knowing the operator matrix in (3.4), we can directly compute that it represents the resolvent of $A_0$. \qed

The following consequence is useful to compute the boundary spectrum of $A$.

**Corollary 3.2.** The imaginary axis belongs to the resolvent set of $A_0$, that is,

\[ i\mathbb{R} \subseteq \rho(A_0). \]

(3.8)

The eigenvectors in $\ker(\gamma - A_m)$ can be computed as follows.
Lemma 3.3. For \( \gamma \in \mathbb{C} \), one has

\[
p \in \ker(\gamma - A_m) \iff p = (p_0, p_1, p_2, p_3, p_4, p_5) \in D(A_m), \text{ with } \quad (3.9)
\]

\[
p_0 = \frac{(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)}{(\gamma + a_0)[(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)] - \mu(\lambda + 2\alpha)(\gamma + a_2)}
\]

\[
\times \sum_{j=3}^{5} c_j \int_0^{\gamma} \mu_j(x) e^{-r_\gamma(x) - \int_0^x \mu_j(x) \, dx} \, dx,
\]

\[
p_1 = \frac{(\lambda + 2\alpha)(\gamma + a_2) \sum_{j=3}^{5} c_j \int_0^{\gamma} \mu_j(x) e^{-r_\gamma(x) - \int_0^x \mu_j(x) \, dx} \, dx}{(\gamma + a_0)[(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)] - \mu(\lambda + 2\alpha)(\gamma + a_2)},
\]

\[
p_2 = \frac{(\lambda + \alpha)(\lambda + 2\alpha) \sum_{j=3}^{5} c_j \int_0^{\gamma} \mu_j(x) e^{-r_\gamma(x) - \int_0^x \mu_j(x) \, dx} \, dx}{(\gamma + a_0)[(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)] - \mu(\lambda + 2\alpha)(\gamma + a_2)},
\]

\[
p_j(x) = c_j e^{-r_\gamma(x) - \int_0^x \mu_j(x) \, dx}, \quad j = 3, 4, 5,
\]

where \( c_3, c_4, c_5 \in \mathbb{C} \).

Proof. If for \( p \in X \), (3.11)–(3.14) are fulfilled, then we can easily compute that \( p \in \ker(\gamma - A_m) \).

Conversely, condition (3.9) gives a system of differential equations. Solving these differential equations, we see that (3.11)–(3.14) are indeed satisfied.

The domain \( D(A_m) \) of the maximal operator \( A_m \) decomposes, using [10, Lemma 1.2], as

\[
D(A_m) = D(A_0) \oplus \ker(\gamma - A_m).
\]

Moreover, since \( L \) is surjective,

\[
L|_{\ker(\gamma - A_m)} : \ker(\gamma - A_m) \longrightarrow \partial X
\]

is invertible for each \( \gamma \in \rho(A_0) \), see [10, Lemma 1.2]. We denote its inverse by

\[
D_\gamma := (L|_{\ker(\gamma - A_m)})^{-1} : \partial X \longrightarrow \ker(\gamma - A_m)
\]

and call it “Dirichlet operator.”

We can give the explicit form of \( D_\gamma \) as follows.
Lemma 3.4. For each \( \gamma \in \rho(A_0) \), the operator \( D_\gamma \) has the form

\[
D_\gamma = \begin{pmatrix}
  d_{1,1} & d_{1,2} & d_{1,3} \\
  d_{2,1} & d_{2,2} & d_{2,3} \\
  d_{3,1} & d_{3,2} & d_{3,3} \\
  d_{4,1} & 0 & 0 \\
  0 & d_{5,2} & 0 \\
  0 & 0 & d_{6,3}
\end{pmatrix},
\]

(3.18)

where

\[
\begin{align*}
d_{1,1} &= \frac{[(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + a)] \int_{0}^{\infty} \mu_3(x)e^{-tx-A_0}dt_1dx}{(\gamma + a_0) \int_{0}^{\infty} \mu_3(x)e^{-tx-A_0}dt_1dx}, \\
d_{1,2} &= \frac{[(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + a)] \int_{0}^{\infty} \mu_4(x)e^{-tx-A_0}dt_1dx}{(\gamma + a_0) \int_{0}^{\infty} \mu_4(x)e^{-tx-A_0}dt_1dx}, \\
d_{1,3} &= \frac{[(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + a)] \int_{0}^{\infty} \mu_5(x)e^{-tx-A_0}dt_1dx}{(\gamma + a_0) \int_{0}^{\infty} \mu_5(x)e^{-tx-A_0}dt_1dx}, \\
d_{2,1} &= \frac{\int_{0}^{\infty} \mu_3(x)e^{-tx-A_0}dt_1dx}{(\gamma + a_0) \int_{0}^{\infty} \mu_3(x)e^{-tx-A_0}dt_1dx}, \\
d_{2,2} &= \frac{\int_{0}^{\infty} \mu_4(x)e^{-tx-A_0}dt_1dx}{(\gamma + a_0) \int_{0}^{\infty} \mu_4(x)e^{-tx-A_0}dt_1dx}, \\
d_{2,3} &= \frac{\int_{0}^{\infty} \mu_5(x)e^{-tx-A_0}dt_1dx}{(\gamma + a_0) \int_{0}^{\infty} \mu_5(x)e^{-tx-A_0}dt_1dx}, \\
d_{3,1} &= \frac{\lambda + 2\alpha}{\gamma + a_0} \int_{0}^{\infty} \mu_3(x)e^{-tx-A_0}dt_1dx, \\
d_{3,2} &= \frac{\lambda + 2\alpha}{\gamma + a_0} \int_{0}^{\infty} \mu_4(x)e^{-tx-A_0}dt_1dx, \\
d_{3,3} &= \frac{\lambda + 2\alpha}{\gamma + a_0} \int_{0}^{\infty} \mu_5(x)e^{-tx-A_0}dt_1dx, \\
d_{4,1} &= e^{-tx-A_0}, \\
d_{5,2} &= e^{-tx-A_0}, \\
d_{6,3} &= e^{-tx-A_0}.
\end{align*}
\]

The operator \( \Phi D_\gamma \) can be computed explicitly for \( \gamma \in \rho(A_0) \).
Remark 3.5. For $\gamma \in \rho(A_0)$ the operator $\Phi D_{\gamma}$ can be represented by the $3 \times 3$-matrix

$$
\Phi D_{\gamma} = \begin{pmatrix}
a_{11} & a_{12} & a_{13} \\
a_{21} & a_{22} & a_{23} \\
a_{31} & a_{32} & a_{33}
\end{pmatrix},
$$

(3.20)

where

$$a_{11} = \frac{\lambda(\lambda + \alpha)(\lambda + 2\alpha) \int_0^\infty \mu_3(x)e^{-\tau x} \int_0^\infty \mu_5(x)dx \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \mu(\lambda + 2\alpha)(\gamma + a_2) \right\} dx}{(\gamma + a_0) \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \mu(\lambda + 2\alpha)(\gamma + a_2) \right\} },
$$

$$a_{12} = \frac{\lambda(\lambda + \alpha)(\lambda + 2\alpha) \int_0^\infty \mu_4(x)e^{-\tau x} \int_0^\infty \mu_5(x)dx \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \mu(\lambda + 2\alpha)(\gamma + a_2) \right\} dx}{(\gamma + a_0) \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \mu(\lambda + 2\alpha)(\gamma + a_2) \right\} },
$$

$$a_{13} = \frac{\lambda(\lambda + \alpha)(\lambda + 2\alpha) \int_0^\infty \mu_5(x)e^{-\tau x} \int_0^\infty \mu_5(x)dx \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \mu(\lambda + 2\alpha)(\gamma + a_2) \right\} dx}{(\gamma + a_0) \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \mu(\lambda + 2\alpha)(\gamma + a_2) \right\} },
$$

$$a_{21} = \frac{\lambda_{b_0} \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \lambda_{b_1} \lambda_{b_2} (\gamma + a_2) \right\} dx}{(\gamma + a_0) \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \mu(\lambda + 2\alpha)(\gamma + a_2) \right\} },
$$

$$a_{22} = \frac{\lambda_{b_0} \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \lambda_{b_1} \lambda_{b_2} (\gamma + a_2) \right\} dx}{(\gamma + a_0) \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \mu(\lambda + 2\alpha)(\gamma + a_2) \right\} },
$$

$$a_{23} = \frac{\lambda_{b_0} \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \lambda_{b_1} \lambda_{b_2} (\gamma + a_2) \right\} dx}{(\gamma + a_0) \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \mu(\lambda + 2\alpha)(\gamma + a_2) \right\} },
$$

$$a_{31} = \frac{\lambda_{b_0} \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \lambda_{b_1} \lambda_{b_2} (\gamma + a_2) \right\} dx}{(\gamma + a_0) \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \mu(\lambda + 2\alpha)(\gamma + a_2) \right\} },
$$

$$a_{32} = \frac{\lambda_{b_0} \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \lambda_{b_1} \lambda_{b_2} (\gamma + a_2) \right\} dx}{(\gamma + a_0) \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \mu(\lambda + 2\alpha)(\gamma + a_2) \right\} },
$$

$$a_{33} = \frac{\lambda_{b_0} \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \lambda_{b_1} \lambda_{b_2} (\gamma + a_2) \right\} dx}{(\gamma + a_0) \left\{ \left( (x + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right) - \mu(\lambda + 2\alpha)(\gamma + a_2) \right\} },
\[
a_{3,3} = \frac{\lambda_0 \left[ (\gamma + a_1)(\gamma + a_2) - \mu (\lambda + \alpha) \right] + \lambda_h (\lambda + 2\alpha)(\gamma + a_2) + \lambda_h (\lambda + \alpha)(\lambda + 2\alpha)}{(\gamma + a_0) \left[ (\gamma + a_1)(\gamma + a_2) - \mu (\lambda + \alpha) \right] - \mu (\lambda + 2\alpha)(\gamma + a_2)} \\
\times \int_0^\infty \mu_s(x) e^{-\frac{\gamma}{\mu_s} - \mu_s(x)} \text{d}x.
\]

(3.21)

The operators \(D_\gamma\) and \(\Phi\) allow to characterise the spectrum \(\sigma(A)\) and the point spectrum \(\sigma_p(A)\) of \(A\). Before doing so we extend the given operators to the product \(X \times \partial X\) as in [13, Section 3].

**Definition 3.6.** (i) \(\mathcal{X} := X \times \partial X\).

(ii) \(\mathcal{A}_0 := \begin{pmatrix} A_0 & 0 \\ -L & 0 \end{pmatrix}\), \(D(\mathcal{A}_0) := D(A_m) \times \{0\}\).

(iii) \(\mathcal{X}_0 := X \times \{0\} = \overline{D(A_m) \times \{0\}} = D(\mathcal{A}_0)\).

(iv) \(\mathcal{B} := \begin{pmatrix} 0 & 0 \\ \Phi & 0 \end{pmatrix}\), \(D(\mathcal{B}) := D(A_m) \times \partial X\).

(v) \(\mathcal{A} := \mathcal{A}_0 + \mathcal{B} = \begin{pmatrix} A_0 & 0 \\ \Phi - L & 0 \end{pmatrix}\), \(D(\mathcal{A}) := D(A_m) \times \{0\}\).

**Remark 3.7.** (i) Note that \(\rho(\mathcal{A}_0) \supseteq \rho(A_0)\). For \(\gamma \in \rho(A_0)\) the resolvent of \(\mathcal{A}_0\) is

\[
R(\gamma, \mathcal{A}_0) = \begin{pmatrix} R(\gamma, A_0) & D_\gamma \\ 0 & 0 \end{pmatrix}.
\]

(ii) The part \(\mathcal{A}|_{\mathcal{X}_0}\) of \(\mathcal{A}\) in \(\mathcal{X}_0\) is

\[
D(\mathcal{A}|_{\mathcal{X}_0}) = D(A) \times \{0\}, \quad \mathcal{A}|_{\mathcal{X}_0} = \begin{pmatrix} A & 0 \\ 0 & 0 \end{pmatrix}.
\]

Hence, \(\mathcal{A}|_{\mathcal{X}_0}\) can be identified with the operator \((A, D(A))\).

The spectrum of \(A\) can be characterised by the spectrum of operators on the boundary space \(\partial X\) as follows.

**Characteristic Equation 3.8.**

Let \(\gamma \in \rho(A_0)\). Then

(i)

\[
\gamma \in \sigma_p(A) \iff 1 \in \sigma_p(\Phi D_\gamma).
\]

(3.24)
(ii) If, in addition, there exists $\gamma_0 \in \mathbb{C}$ such that $1 \not\in \sigma(\Phi D_{\gamma_0})$, then

$$
\gamma \in \sigma(A) \iff 1 \in \sigma(\Phi D_{\gamma}).
$$

(3.25)

Proof. Let us first show the equivalence

$$
\gamma \in \sigma(A) \iff 1 \in \sigma(\Phi D_{\gamma}).
$$

(3.26)

We can decompose $\gamma - \mathcal{A}$ as

$$
\gamma - \mathcal{A} = \gamma - \mathcal{A}_0 - \mathcal{B} = (\mathcal{O} - \mathcal{B}R(\gamma, \mathcal{A}_0))(\gamma - \mathcal{A}_0).
$$

(3.27)

We conclude from this that the invertibility of $\gamma - \mathcal{A}$ is equivalent to the invertibility of $\mathcal{O} - \mathcal{B}R(\gamma, \mathcal{A}_0)$. From

$$
\mathcal{O} - \mathcal{B}R(\gamma, \mathcal{A}_0) = \begin{pmatrix}
Id_X & 0 \\
-\Phi R(\gamma, A_0) & Id_{\partial X} - \Phi D_{\gamma}
\end{pmatrix},
$$

(3.28)

one can easily see that $\mathcal{O} - \mathcal{B}R(\gamma, \mathcal{A}_0)$ is invertible if and only if $1 \not\in \sigma(\Phi D_{\gamma_0})$. This proves (3.26).

Since by our assumption $1 \not\in \sigma(\Phi D_{\gamma_0})$, it follows that $\gamma_0 \in \rho(\mathcal{A})$. Therefore, $\rho(\mathcal{A})$ is not empty. Hence we obtain from [6, Proposition IV.2.17] that

$$
\sigma(\mathcal{A}) = \sigma(A),
$$

(3.29)

since $A$ is the part of $\mathcal{A}$ in $\mathcal{X}_0$. This shows (iii).

To prove (i) observe first that $\mathcal{A}$ and $A$ have the same point spectrum, that is,

$$
\sigma_p(\mathcal{A}) = \sigma_p(A).
$$

(3.30)

Suppose now that $1 \in \sigma_p(\Phi D_{\gamma})$. Then there exists $0 \neq f \in \partial X$ such that $(Id_{\partial X} - \Phi D_{\gamma})f = 0$. Since $0 \neq \begin{pmatrix} D_{\gamma} f \\ 0 \end{pmatrix} \in D(\mathcal{A})$, we can compute

$$
\begin{pmatrix}
\gamma - \mathcal{A} \\
\begin{pmatrix} D_{\gamma} f \\ 0 \end{pmatrix}
\end{pmatrix} = \begin{pmatrix}
Id_X & 0 \\
-\Phi R(\gamma, A_0) & Id_{\partial X} - \Phi D_{\gamma}
\end{pmatrix} \begin{pmatrix}
\begin{pmatrix} (\gamma - A_m) D_{\gamma} f \\ LD_{\gamma} f \end{pmatrix} \\
0
\end{pmatrix} = \begin{pmatrix}
Id_X & 0 \\
-\Phi R(\gamma, A_0) & Id_{\partial X} - \Phi D_{\gamma}
\end{pmatrix} \begin{pmatrix} 0 \\ f \end{pmatrix} = \begin{pmatrix} 0 \\ (Id_{\partial X} - \Phi D_{\gamma})f \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}.
$$

(3.31)

This shows that $\gamma \in \sigma_p(\mathcal{A})$. 

Conversely, if we assume that $\gamma \in \sigma_p(\mathcal{A})$, then there exists $0 \neq f \in D(A_m)$ such that $(\gamma - \mathcal{A})\begin{pmatrix} f \\ 0 \end{pmatrix} = 0$. From

\[
\begin{pmatrix} 0 \\ 0 \end{pmatrix} = (\gamma - \mathcal{A})\begin{pmatrix} f \\ 0 \end{pmatrix}
= \begin{pmatrix} Id_X & 0 \\ -\Phi R(\gamma, A_0) Id_{\partial X} - \Phi D & \end{pmatrix} \begin{pmatrix} (\gamma - A_m)f \\ Lf \end{pmatrix}
= \begin{pmatrix} (\gamma - A_m)f \\ -\Phi R(\gamma, A_0)(\gamma - A_m)f + (Id_{\partial X} - \Phi D)Lf \end{pmatrix}
\]

we conclude that $f \in \ker(\gamma - A_m)$ and thus

\[
0 = -\Phi R(\gamma, A_0)(\gamma - A_m)f + (Id_{\partial X} - \Phi D)Lf = (Id_{\partial X} - \Phi D)Lf.
\] (3.33)

It follows from the decomposition (3.15) that $Lf \neq 0$ and hence $1 \in \sigma_p(\Phi D)$. \(\square\)

Using the Characteristic Equation 3.8 we can show that 0 is in the point spectrum of $A$.

**Lemma 8.8.** For the operator $(A, D(A))$ one has $0 \in \sigma_p(A)$.

**Proof.** By the Characteristic Equation 3.8 it suffices to prove that $1 \in \sigma_p(\Phi D_0)$. Since

\[
\Phi D_0 = \begin{pmatrix} b_{1,1} & b_{1,2} & b_{1,3} \\ b_{2,1} & b_{2,2} & b_{2,3} \\ b_{3,1} & b_{3,2} & b_{3,3} \end{pmatrix},
\] (3.34)

where

\[
b_{1,1} = \frac{\lambda(\lambda + \alpha)(\lambda + 2\alpha)}{a_0[a_1a_2 - \mu(\lambda + \alpha)] - \mu(\lambda + 2\alpha)a_2},
\]

\[
b_{1,2} = \frac{\lambda(\lambda + \alpha)(\lambda + 2\alpha)}{a_0[a_1a_2 - \mu(\lambda + \alpha)] - \mu(\lambda + 2\alpha)a_2},
\]

\[
b_{1,3} = \frac{\lambda(\lambda + \alpha)(\lambda + 2\alpha)}{a_0[a_1a_2 - \mu(\lambda + \alpha)] - \mu(\lambda + 2\alpha)a_2},
\]

\[
b_{2,1} = \frac{\lambda_0[a_1a_2 - \mu(\lambda + \alpha)] + \lambda c_1(\lambda + 2\alpha)a_2 + \lambda c_2(\lambda + \alpha)(\lambda + 2\alpha)}{a_0[a_1a_2 - \mu(\lambda + \alpha)] - \mu(\lambda + 2\alpha)a_2},
\]
\[ b_{2,2} = \frac{\lambda_{c_0} [a_1 a_2 - \mu(\lambda + \alpha)] + \lambda_{c_1} (\lambda + 2\alpha) a_2 + \lambda_{c_2} (\lambda + \alpha) (\lambda + 2\alpha)}{(\gamma + a_0)(\gamma + a_1) (\gamma + a_2) - \mu(\lambda + \alpha)] - \mu (\lambda + 2\alpha) (\gamma + a_2)}, \]

\[ b_{2,3} = \frac{\lambda_{c_0} [a_1 a_2 - \mu(\lambda + \alpha)] + \lambda_{c_1} (\lambda + 2\alpha) a_2 + \lambda_{c_2} (\lambda + \alpha) (\lambda + 2\alpha)}{a_0 [a_1 a_2 - \mu(\lambda + \alpha)] - \mu (\lambda + 2\alpha) a_2}, \]

\[ b_{3,1} = \frac{\lambda_{\alpha_0} [a_1 a_2 - \mu(\lambda + \alpha)] + \lambda_{\alpha_1} (\lambda + 2\alpha) a_2 + \lambda_{\alpha_2} (\lambda + \alpha) (\lambda + 2\alpha)}{a_0 [a_1 a_2 - \mu(\lambda + \alpha)] - \mu (\lambda + 2\alpha) a_2}, \]

\[ b_{3,2} = \frac{\lambda_{\beta_0} [a_1 a_2 - \mu(\lambda + \alpha)] + \lambda_{\beta_1} (\lambda + 2\alpha) a_2 + \lambda_{\beta_2} (\lambda + \alpha) (\lambda + 2\alpha)}{a_0 [a_1 a_2 - \mu(\lambda + \alpha)] - \mu (\lambda + 2\alpha) a_2}, \]

\[ b_{3,3} = \frac{\lambda_{\beta_0} [a_1 a_2 - \mu(\lambda + \alpha)] + \lambda_{\beta_1} (\lambda + 2\alpha) a_2 + \lambda_{\beta_2} (\lambda + \alpha) (\lambda + 2\alpha)}{a_0 [a_1 a_2 - \mu(\lambda + \alpha)] - \mu (\lambda + 2\alpha) a_2}. \]

(3.35)

We can compute the \( j \)th column sum \(( j = 1, 2, 3)\) of the 3 \( \times \) 3 matrix \( \Phi D_0 \) as follows:

\[
\sum_{i=1}^{3} (\Phi D_0)_{i,j} = b_{1,j} + b_{2,j} + b_{3,j}
\]

\[
= \frac{\lambda (\lambda + \alpha)(\lambda + 2\alpha)}{a_0 [a_1 a_2 - \mu(\lambda + \alpha)] - \mu (\lambda + 2\alpha) a_2}
\]

\[
+ \frac{\lambda_{c_0} [a_1 a_2 - \mu(\lambda + \alpha)] + \lambda_{c_1} (\lambda + 2\alpha) a_2 + \lambda_{c_2} (\lambda + \alpha) (\lambda + 2\alpha)}{a_0 [a_1 a_2 - \mu(\lambda + \alpha)] - \mu (\lambda + 2\alpha) a_2}
\]

\[
+ \frac{\lambda_{\beta_0} [a_1 a_2 - \mu(\lambda + \alpha)] + \lambda_{\beta_1} (\lambda + 2\alpha) a_2 + \lambda_{\beta_2} (\lambda + \alpha) (\lambda + 2\alpha)}{a_0 [a_1 a_2 - \mu(\lambda + \alpha)] - \mu (\lambda + 2\alpha) a_2}
\]

\[
= \frac{(\lambda_{c_0} + \lambda_{\beta_0}) [a_1 a_2 - \mu(\lambda + \alpha)] + (\lambda_{c_1} + \lambda_{\beta_1}) (\lambda + 2\alpha) a_2}{a_0 [a_1 a_2 - \mu(\lambda + \alpha)] - \mu (\lambda + 2\alpha) a_2}
\]

\[
+ \frac{(\lambda + \lambda_{c_2} + \lambda_{\beta_2}) (\lambda + \alpha) (\lambda + 2\alpha)}{a_0 [a_1 a_2 - \mu(\lambda + \alpha)] - \mu (\lambda + 2\alpha) a_2}
\]

\[
= \frac{[a_0 - (\lambda + 2\alpha)] [a_1 a_2 - \mu(\lambda + \alpha)] + [a_1 - (\mu + \lambda + \alpha)] (\lambda + 2\alpha) a_2}{a_0 [a_1 a_2 - \mu(\lambda + \alpha)] - \mu (\lambda + 2\alpha) a_2}
\]

\[
+ \frac{(\lambda + 2\alpha)(\lambda + 2\alpha)}{a_0 [a_1 a_2 - \mu(\lambda + \alpha)] - \mu (\lambda + 2\alpha) a_2}
\]

\[
= \frac{a_0 [a_1 a_2 - \mu(\lambda + \alpha)] - a_1 a_2 (\lambda + 2\alpha) + \mu (\lambda + \alpha) (\lambda + 2\alpha)}{a_0 [a_1 a_2 - \mu(\lambda + \alpha)] - \mu (\lambda + 2\alpha) a_2}
\]

\[
+ \frac{a_1 a_2 (\lambda + 2\alpha) - \mu (\lambda + 2\alpha) a_2 - a_2 (\lambda + \alpha) (\lambda + 2\alpha)}{a_0 [a_1 a_2 - \mu(\lambda + \alpha)] - \mu (\lambda + 2\alpha) a_2}
\]
Proof. For any $a \in \mathbb{R}$, $a \neq 0$, $\Psi = (\psi_0, \psi_1, \psi_2, \psi_3(x), \psi_4(x), \psi_5(x)) \in X$, we consider the resolvent equation

$$(aiId - A)P = \Psi,$$  

where $P = (p_0, p_1, p_2, p_3(x), p_4(x), p_5(x))$. This equation is equivalent to the following system of equations:

$$(ai - a_0)p_0 + \mu p_1 + \sum_{j=3}^{5} \int_{0}^{\infty} \mu_j(x)p_j(x)dx = \psi_0,$$  

$$-(\lambda + 2\alpha)p_0 + (ai - a_1)p_1 - \mu p_2 = \psi_1,$$  

$$-(\lambda + \alpha)p_1 + (ai - a_2)p_2 = \psi_2,$$  

$$\frac{dp_j(x)}{dx} + (ai - \mu_j(x))p_j(x) = \psi_j(x), \quad j = 3, 4, 5,$$  

$$p_3(0) = \lambda p_2, \quad t > 0,$$  

$$p_4(0) = \sum_{i=0}^{2} \lambda_i p_i,$$  

$$p_5(0) = \sum_{i=0}^{2} \lambda_i p_i.$$  

Solving (3.42)–(3.45), we get

$$p_j(x) = p_j(0)e^{-aix-\int_{0}^{x} \mu_j(\xi)d\xi} + e^{-ai(x-x_{0})} \int_{0}^{x} \psi_j(u)e^{aiu+\int_{0}^{u} \mu_j(\xi)d\xi}du.$$  

(3.46)

This shows that $\Phi D_0$ is column stochastic, its transpose $(\Phi D_0)^t$ is row stochastic, and hence $1 \in \sigma_p((\Phi D_0)^t)$. Since $\sigma_p(\Phi D_0) = \sigma_p((\Phi D_0)^t)$, also $1 \in \sigma_p(\Phi D_0)$ holds. Therefore, by the Characteristic Equation 3.8 we conclude that $0 \in \sigma_p(A)$.  

Indeed, 0 is even the only spectral value of $A$ on the imaginary axis.

**Lemma 8.9.** Under Assumption 1.1, the spectrum $\sigma(A)$ of $A$ satisfies

$$\sigma(A) \cap i\mathbb{R} = \{0\}. \quad (3.37)$$

**Proof.** For any $a \in \mathbb{R}$, $a \neq 0$, $\Psi = (\psi_0, \psi_1, \psi_2, \psi_3(x), \psi_4(x), \psi_5(x)) \in X$, we consider the resolvent equation
Since
\[
\int_0^\infty |p_j(x)| \, dx = |p_j(0)| \int_0^\infty e^{-ax} f_j(\mu_j) \, dx + \int_0^\infty \left[ e^{-\int_0^u \mu_j(\xi) \, d\xi} \int_0^u |q_j(\mu_j) e^{\int_0^u \mu_j(\xi) \, d\xi} \, du \right] \, dx,
\]
(3.47)
\[
\int_0^\infty \left[ e^{-\int_0^u \mu_j(\xi) \, d\xi} \int_0^u |q_j(\mu_j) e^{\int_0^u \mu_j(\xi) \, d\xi} \, du \right] \, dx = \int_0^\infty \left[ q_j(\mu_j) e^{\int_0^u \mu_j(\xi) \, d\xi} \int_0^\infty e^{-\int_0^u \mu_j(\xi) \, d\xi} \, du \right] \, dx.
\]
By Assumption 1.1, we have
\[
\lim_{u \to +\infty} e^{\int_0^u \mu_j(\xi) \, d\xi} \int_0^u e^{-\int_0^u \mu_j(\xi) \, d\xi} \, dx = \lim_{u \to +\infty} \int_0^u e^{-\int_0^u \mu_j(\xi) \, d\xi} \, dx = \lim_{u \to +\infty} \frac{e^{-\int_0^u \mu_j(\xi) \, d\xi} \, dx}{\mu_j(u) e^{-\int_0^u \mu_j(\xi) \, d\xi}} = \lim_{u \to +\infty} \frac{1}{\mu_j(u)} < +\infty.
\]
It follows that \( p_j(x) \in L^1[0, +\infty), \ j = 3, 4, 5. \) Let
\[
I_j = \int_0^\infty \mu_j(x) e^{-ax} f_j(\mu_j) \, dx,
\]
(3.49)
\[
K_j = \int_0^\infty \left[ \mu_j(x) e^{-ax} f_j(\mu_j) \int_0^x q_j(\mu_j) e^{\int_0^x \mu_j(\xi) \, d\xi} \, du \right] \, dx.
\]
Then
\[
|I_j| \leq \int_0^\infty \mu_j(x) e^{-ax} f_j(\mu_j) \, dx = 1,
\]
(3.50)
\[
|K_j| \leq \int_0^\infty \left[ \mu_j(x) e^{-ax} f_j(\mu_j) \int_0^x |q_j(\mu_j) e^{\int_0^x \mu_j(\xi) \, d\xi} \, du \right] \, dx.
\]
Since
\[
\int_0^\infty \mu_j(x) p_j(x) \, dx = p_j(0) I_j + K_j,
\]
(3.51)
hence \( \mu_j(x) p_j(x) \in L^1[0, +\infty), \ j = 3, 4, 5. \)
Substituting \( p_j(x) \) into (3.39)–(3.41) we get the following system of equations:

\[
(ai + a_0 - \lambda c_1 I_4 - \lambda h_0 I_5) p_0 - (\mu + \lambda c_1 + \lambda h_0 I_5) p_1 \\
- (\lambda I_5 + \lambda c_2 I_4 + \lambda h_1 I_5) p_2 = q_0 + K_3 + K_4 + K_5 \\
(-\lambda - 2\alpha) p_0 + (ai + a_1) p_1 - \mu p_2 = q_1, \\
(-\lambda - \alpha) p_1 + (ai + a_2) p_2 = q_2.
\]

The matrix of the coefficient of the above system is denoted by

\[
D = \begin{pmatrix}
ai + a_0 - \lambda c_1 I_4 - \lambda h_0 I_5 & -\mu - \lambda c_1 - \lambda h_0 I_5 & -\lambda I_5 - \lambda c_2 I_4 - \lambda h_1 I_5 \\
-\lambda - 2\alpha & ai + a_1 & -\mu \\
0 & -\lambda - \alpha & ai + a_2
\end{pmatrix}.
\]

Since

\[
|ai + a_0 - \lambda c_1 I_4 - \lambda h_0 I_5| \geq |ai + a_0| - |\lambda c_1| |I_4| - |\lambda h_0| |I_5|
\]
\[
> |ai + a_0| - \lambda c_1 - \lambda h_0 \\
> a_0 - \lambda c_0 - \lambda h_0 = \lambda + 2\alpha,
\]
\[
|-\mu - \lambda c_1 - \lambda h_0 I_5| + |\lambda - \alpha| \leq \mu + \lambda c_1 |I_4| + \lambda h_0 |I_5| + \lambda + \alpha
\]
\[
< \mu + \lambda c_1 + \lambda h_1 + \lambda + \alpha = a_1
\]
\[
< |ai + a_1|,
\]
\[
|-\lambda I_5 - \lambda c_2 I_4 - \lambda h_2 I_5| + |\mu| \leq \lambda |I_3| + \lambda c_1 |I_4| + \lambda h_2 |I_5| + \mu
\]
\[
< \lambda + \lambda c_2 + \lambda h_2 + \mu = a_2
\]
\[
< |ai + a_2|.
\]

This shows that the matrix \( D \) is a diagonally dominant matrix, it follows that the determinant of the matrix \( D \) is not equal to 0. Therefore, system (3.52) has a unique solution \((p_0, p_1, p_2)\). Combining this with (3.46) we obtain that the equation \((aiId - A)P = \Psi\) has exactly one solution \((p_0, p_1, p_2, p_3(x), p_4(x), p_5(x)) \in D(A)\), this yields \( ai \in \rho(A) \). \( \square \)

### 4. Well-Posedness of the System

The main goal in this section is to prove the well-posedness of the system. In order to prove this, we will need some lemmas.

**Lemma 8.1.** \( A : D(A) \to R(A) \subset X \) is a closed linear operator and \( D(A) \) is dense in \( X \).
Proof. We will prove the assertion in two steps.

We first prove that $A$ is closed. For any given

$$P_n = \left( p_0^{(n)}, p_1^{(n)}, p_2^{(n)}, p_3^{(n)}(x), p_4^{(n)}(x), p_5^{(n)}(x) \right)^t \in D(A),$$

$$P_0 = \left( p_0^{(0)}, p_1^{(0)}, p_2^{(0)}, p_3^{(0)}(x), p_4^{(0)}(x), p_5^{(0)}(x) \right)^t \in X.$$  (4.1)

We suppose that

$$\lim_{n \to \infty} P_n = P_0,$$

$$\lim_{n \to \infty} AP_n = F,$$  (4.2)

where $F = (f_0, f_1, f_2, f_3(x), f_4(x), f_5(x))^t \in X$. That is,

$$\lim_{n \to \infty} p_i^{(n)} = p_i^{(0)} \quad (i = 0, 1, 2),$$

$$\lim_{n \to \infty} \int_0^\infty \left| p_j^{(n)}(x) - p_j^{(0)}(x) \right| dx = 0 \quad (j = 3, 4, 5).$$  (4.3)

Then we obtain from Assumption 1.1 that

$$\lim_{n \to \infty} \int_0^\infty p_j^{(n)}(x) \mu_j(x) dx = \int_0^\infty p_j^{(0)}(x) \mu_j(x) \quad j = 3, 4, 5.$$  (4.4)

Furthermore,

$$\lim_{n \to \infty} AP_n = \lim_{n \to \infty} \begin{pmatrix} -a_0 p_0^{(n)} + \mu p_1^{(n)} + \sum_{i=3}^5 \int_0^\infty \mu_i(x) p_i^{(n)}(x) \, dx \\ (\lambda + 2\alpha) p_0^{(n)} - a_1 p_1^{(n)} + \mu p_2^{(n)} \\ (\lambda + \alpha) p_1^{(n)} - a_2 p_2^{(n)} \\ -\frac{dp_3^{(n)}(x)}{dx} - \mu_3(x) p_3^{(n)}(x) \\ -\frac{dp_4^{(n)}(x)}{dx} - \mu_4(x) p_4^{(n)}(x) \\ -\frac{dp_5^{(n)}(x)}{dx} - \mu_5(x) p_5^{(n)}(x) \end{pmatrix} = \begin{pmatrix} f_0 \\ f_1 \\ f_2 \\ f_3(x) \\ f_4(x) \\ f_5(x) \end{pmatrix}.$$  (4.5)
This is equivalent to the following system of equations:

\[
\lim_{n \to \infty} \left[ -a_0 p_0^{(n)} + \mu p_1^{(n)} + \sum_{i=3}^{5} \int_0^{\infty} \mu_i(x)p_i^{(n)}(x)dx \right] = f_0,
\]

\[
\lim_{n \to \infty} \left[ (\lambda + 2\alpha)p_0^{(n)} - a_1 p_1^{(n)} + \mu p_2^{(n)} \right] = f_1,
\]

\[
\lim_{n \to \infty} \left[ (\lambda + \alpha)p_1^{(n)} - a_2 p_2^{(n)} \right] = f_2,
\]

\[
\lim_{n \to \infty} \left[ -\frac{dp_3^{(n)}(x)}{dx} - \mu_3(x)p_3^{(n)}(x) \right] = f_3(x),
\]

\[
\lim_{n \to \infty} \left[ -\frac{dp_4^{(n)}(x)}{dx} - \mu_4(x)p_4^{(n)}(x) \right] = f_4(x),
\]

\[
\lim_{n \to \infty} \left[ -\frac{dp_5^{(n)}(x)}{dx} - \mu_5(x)p_5^{(n)}(x) \right] = f_5(x).
\]

Integrating both sides of last three equations from 0 to \( \beta > 0 \), we have

\[
\lim_{n \to \infty} \int_0^{\beta} \left[ -\frac{dp_j^{(n)}(x)}{dx} - \mu_j(x)p_j^{(n)}(x) \right] dx = \int_0^{\beta} \lim_{n \to \infty} \left[ -\frac{dp_j^{(n)}(x)}{dx} - \mu_j(x)p_j^{(n)}(x) \right] dx
\]

\[
= \int_0^{\beta} f_j(x), \quad j = 3, 4, 5.
\]

This yields

\[
\lim_{n \to \infty} \left[ -p_j^{(n)}(\beta) - p_j^{(n)}(0) - \int_0^{\beta} \mu_j(x)p_j^{(n)}(x)dx \right] = -p_j^{(0)}(\beta) - p_j^{(0)}(0) - \int_0^{\beta} \mu_j(x)p_j^{(0)}(x)dx
\]

\[
= \int_0^{\beta} f_j(x), \quad j = 3, 4, 5.
\]

We know from the boundedness of \( \mu_j(x) \) that \( \int_0^{\infty} |\mu_j(x)p_j^{(0)}(x)|dx < \infty \). Furthermore, we have \( \int_0^{\infty} |f_j(x)|dx < \infty \). It follows from (4.8) that \( p_j^{(0)}(\beta) \) is absolutely continuous and

\[
p_j^{(0)}(\beta) = -\mu_j(\beta)p_j^{(0)}(\beta) - f_j(x) \in L^1[0, \infty).
\]

Therefore, \( P_0 \in D(A) \) and

\[
\lim_{n \to \infty} p_j^{(n)}(\beta) = \lim_{n \to \infty} \left[ -\mu_j(\beta)p_j^{(n)}(\beta) \right] - f_j(x) = p_j^{(0)}(\beta).
\]
From the above deduction we have

\[-a_0p_0^{(0)} + \mu p_1^{(0)} + \sum_{i=3}^{5} \int_0^{\infty} \mu_i(x)p_i^{(0)}(x)dx = f_0,\]

\[(\lambda + 2a)p_0^{(0)} - a_1p_1^{(0)} + \mu p_2^{(0)} = f_1,\]

\[(\lambda + a)p_1^{(0)} - a_2p_2^{(0)} = f_2,\]

\[-\frac{dp_3^{(0)}(x)}{dx} - \mu_3(x)p_3^{(0)}(x) = f_3(x),\]

\[-\frac{dp_4^{(0)}(x)}{dx} - \mu_4(x)p_4^{(0)}(x) = f_4(x),\]

\[-\frac{dp_5^{(0)}(x)}{dx} - \mu_5(x)p_5^{(0)}(x) = f_5(x).\]  \hspace{1cm} (4.11)

This shows that \( A(P_0)^t = (F)^t \), hence \((A, D(A))\) is closed.

We now prove that \( D(A) \) is dense in \( X \). We define

\[ E = \left\{ p(x) = (p_0, p_1, p_2, p_3(x), p_4(x), p_5(x)) \middle| \begin{array}{l}
  p_i \in \mathbb{C}, \ i = 0, 1, 2, \\
  p_i(x) \in C_0^\infty[0, \infty), \ i = 3, 4, 5
\end{array} \right\} \]  \hspace{1cm} (4.12)

Then by [14] \( E \) is dense in \( X \). If we define

\[ H = \left\{ p(x) = (p_0, p_1, p_2, p_3(x), p_4(x), p_5(x)) \middle| \begin{array}{l}
  p_i \in C^\infty[0, \infty) \text{ and} \\
  \text{there exists a number} \\
  \alpha_i \text{ such that} p_i(x) = 0, \\
  \text{for} \ x \in [0, \alpha_i], \ i = 3, 4, 5
\end{array} \right\}, \]  \hspace{1cm} (4.13)

then \( H \) is dense in \( E \). Therefore, in order to prove that \( D(A) \) is dense in \( X \), it suffices to prove that \( D(A) \) is dense in \( H \). Take any

\[ p(x) = (p_0, p_1, p_2, p_3(x), p_4(x), p_5(x)) \in H, \]  \hspace{1cm} (4.14)

then there exist numbers \( \alpha_i \) such that \( p_i(x) = 0 \), for all \( x \in [0, \alpha_i] \) (\( i = 3, 4, 5 \)); that is, \( p_i(x) = 0 \) for \( x \in [0, s] \), here \( 0 < s = \min\{\alpha_3, \alpha_4, \alpha_5\} \). We introduce a function

\[ q^s(0) = (q_0^s, q_1^s, q_2^s(0), q_3^s(0), q_4^s(0), q_5^s(0)) \]

\[ = \left( p_0, p_1, p_2, \lambda p_2, \sum_{i=0}^{2} \lambda_i p_i, \sum_{i=0}^{2} \lambda_i p_i \right) \]  \hspace{1cm} (4.15)

\[ q^s(x) = (q_0^s, q_1^s, q_2^s(x), q_3^s(x), q_4^s(x), q_5^s(x)), \]
where

\[ \psi^s_i(x) = \begin{cases} \psi^s_i(0) \left(1 - \frac{x}{s}\right)^2 & \text{if } x \in [0, s), \quad i = 3, 4, 5, \\ p_i(x) & \text{if } x \in [s, \infty), \end{cases} \]

(4.16)

It is easy to verify that \( \psi^s(x) \in D(A) \). Moreover

\[
\|p - \psi^s\| = \sum_{i=3}^{5} \int_0^s |\psi^s_i(0)| \left(1 - \frac{x}{s}\right)^2 dx = \sum_{i=3}^{5} |\psi^s_i(0)| \frac{s}{3} \rightarrow 0 \quad \text{as } s \rightarrow 0. \quad (4.17)
\]

This shows that \( D(A) \) is dense in \( H \).

Lemma 8.2. (A, D(A)) is a dispersive operator.

Proof. For \( p \in D(A) \), we may choose

\[
\phi(x) = \left( \frac{p_1}{p_0}, \frac{p_1}{p_1}, \frac{p_2}{p_2}, \frac{p_3(x)}{p_3(x)}, \frac{p_4(x)}{p_4(x)}, \frac{p_5(x)}{p_5(x)} \right), \quad (4.18)
\]

where

\[
[p_i]^+ = \begin{cases} p_i & \text{if } p_i > 0, \\ 0 & \text{if } p_i \leq 0, \end{cases} \quad i = 0, 1, 2, \\
[p_i(x)]^+ = \begin{cases} p_i(x) & \text{if } p_i(x) > 0, \\ 0 & \text{if } p_i(x) \leq 0, \end{cases} \quad i = 3, 4, 5. \quad (4.19)
\]

If we define \( W_i = \{ x \in [0, \infty) \mid p_i(x) > 0 \} \) and \( Q_i = \{ x \in [0, \infty) \mid p_i(x) \leq 0 \} \) for \( i = 3, 4, 5 \), then we have

\[
\int_0^\infty \frac{dp_i(x)}{dx} \frac{[p_i(x)]^+}{p_i(x)} dx = \int_{W_i} \frac{dp_i(x)}{dx} \frac{[p_i(x)]^+}{p_i(x)} dx + \int_{Q_i} \frac{dp_i(x)}{dx} \frac{[p_i(x)]^+}{p_i(x)} dx
\]

\[
= \int_{W_i} \frac{dp_i(x)}{dx} \frac{[p_i(x)]^+}{p_i(x)} dx + \int_{Q_i} \frac{dp_i(x)}{dx} \frac{[p_i(x)]^+}{p_i(x)} dx
\]

\[
= \int_0^\infty \frac{d[p_i(x)]^+}{dx} dx = -[p_i(0)]^+, \quad i = 3, 4, 5, \quad (4.20)
\]

\[
\int_0^\infty \mu_i(x)p_i(x) dx \leq \int_0^\infty \mu_i(x)[p_i(x)]^+ dx, \quad i = 3, 4, 5.
\]
By (4.20) and the boundary conditions on \( p \in D(A) \) we obtain that

\[
\langle Ap, \phi \rangle = \left\{ \begin{array}{l}
-a_0 p_0 + \mu p_1 + \sum_{i=3}^{5} \int_{0}^{\infty} \mu_i(x)p_i(x)dx \frac{[p_0]^+}{p_0} \\
+ \left\{ (\lambda + 2\alpha)p_0 - a_1p_1 + \mu p_2 \right\} \frac{[p_1]^+}{p_1} + \left\{ (\lambda + \alpha)p_1 - a_2p_2 \right\} \frac{[p_2]^+}{p_2} \\
+ \sum_{i=3}^{5} \int_{0}^{\infty} \left\{ \frac{-dp_i(x)}{dx} - \mu_i(x)p_i(x) \right\} \frac{[p_i(x)]^+}{p_i(x)}dx \\
\end{array} \right.
\]

\[
= -a_0 [p_0]^+ + \mu p_1 \frac{[p_0]^+}{p_0} + \sum_{i=3}^{5} \int_{0}^{\infty} \mu_i(x)p_i(x)dx \\
+ (\lambda + 2\alpha) \frac{[p_1]^+}{p_1}p_0 - a_1 [p_1]^+ + \mu \frac{[p_1]^+}{p_1}p_1 + (\lambda + \alpha) \frac{[p_2]^+}{p_2}p_1 \\
- a_2 [p_2]^+ - \sum_{i=3}^{5} \int_{0}^{\infty} dp_i(x) \frac{[p_i(x)]^+}{p_i(x)}dx \\
\]

\[
= -a_0 [p_0]^+ + \mu p_1 \frac{[p_0]^+}{p_0} + \sum_{i=3}^{5} \int_{0}^{\infty} \mu_i(x)p_i(x)dx \\
+ (\lambda + 2\alpha) \frac{[p_1]^+}{p_1}p_0 - a_1 [p_1]^+ + \mu \frac{[p_1]^+}{p_1}p_1 + (\lambda + \alpha) \frac{[p_2]^+}{p_2}p_1 \\
- a_2 [p_2]^+ - \sum_{i=3}^{5} \int_{0}^{\infty} \mu_i(x)p_i(x)dx \\
\leq -a_0 [p_0]^+ + \mu p_1 \frac{[p_0]^+}{p_0} + \sum_{i=3}^{5} \int_{0}^{\infty} \mu_i(x)p_i(x)dx \\
+ (\lambda + 2\alpha) \frac{[p_1]^+}{p_1}p_0 - a_1 [p_1]^+ + \mu \frac{[p_1]^+}{p_1}p_1 + (\lambda + \alpha) \frac{[p_2]^+}{p_2}p_1 \\
- a_2 [p_2]^+ + \left\{ \lambda [p_2]^+ + \left[ \lambda_{c_i} p_0 + \lambda_{c_i} p_1 + \lambda_{c_i} p_2 \right]^+ + \left[ \lambda_{h_i} p_0 + \lambda_{h_i} p_1 + \lambda_{h_i} p_2 \right]^+ \right\} \\
- \sum_{i=3}^{5} \int_{0}^{\infty} \mu_i(x)[p_i(x)]^+dx
\]
This shows that \((A, D(A))\) is a dispersive operator.
Lemma 8.3. If $\gamma \in \mathbb{R}$, $\gamma > 0$, then $\gamma \in \rho(A)$.

Proof. Let $\gamma \in \mathbb{R}$, $\gamma > 0$, then all the entries of $\Phi D_\gamma$ are positive and we have

$$a_0 \left[ (\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right] - \mu(\lambda + 2\alpha)(\gamma + a_2) - \gamma(\lambda + 2\alpha)(\gamma + a_2)$$

$$= (\lambda + 2\alpha + \lambda c_3 + \lambda h_2)(\gamma + \mu + \lambda + \lambda c_1 + \lambda h_1)(\gamma + \mu + \lambda + \lambda c_2 + \lambda h_2)$$

$$- (\lambda + 2\alpha + \lambda c_3 + \lambda h_2)\mu(\lambda + \alpha) - \mu(\lambda + 2\alpha)(\gamma + \mu + \lambda + \lambda c_2 + \lambda h_2)$$

$$- \gamma(\lambda + 2\alpha)(\gamma + \mu + \lambda + \lambda c_2 + \lambda h_2)$$

$$= \left[ (\lambda + 2\alpha + \lambda c_3 + \lambda h_2)\gamma(\gamma + \mu + \lambda + \lambda c_2 + \lambda h_2) \right]$$

$$- \gamma(\lambda + 2\alpha)(\gamma + \mu + \lambda + \lambda c_2 + \lambda h_2)$$

$$+ \left[ (\lambda + 2\alpha + \lambda c_3 + \lambda h_2)\mu(\gamma + \mu + \lambda + \lambda c_2 + \lambda h_2) \right]$$

$$- \mu(\lambda + 2\alpha)(\gamma + \mu + \lambda c_2 + \lambda h_2)$$

$$+ \left[ (\lambda + 2\alpha + \lambda c_3 + \lambda h_2)(\lambda + \alpha + \lambda c_1 + \lambda h_1)(\gamma + \mu + \lambda + \lambda c_2 + \lambda h_2) \right]$$

$$- \lambda + 2\alpha + \lambda c_3 + \lambda h_2)\mu(\gamma + \mu + \lambda + \alpha) > 0$$

$$\Rightarrow a_0 \left[ (\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha) \right] - \mu(\lambda + 2\alpha)(\gamma + a_2) > \gamma(\lambda + 2\alpha)(\gamma + a_2).$$

We also have

$$\int_0^\infty \mu_j(x)e^{-x}\int_0^\infty \mu_i(x)\int_0^\infty e^{-x}\int_0^\infty \mu_i(x)dxds < \int_0^\infty \mu_j(x)e^{-x}\int_0^\infty \mu_i(x)dxds = 1. \quad (4.23)$$

Using (4.22) and (4.23) we can estimate the $j$th column sum as

$$\sum_{i=1}^3 (\Phi D_\gamma)_{i,j} = \frac{\lambda(\lambda + \alpha)(\lambda + 2\alpha)}{(\gamma + a_0)[(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)] - \mu(\lambda + 2\alpha)(\gamma + a_2)}$$

$$+ \frac{\lambda c_3[(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)] + \lambda c_2[(\gamma + a_1)(\gamma + a_2) + \lambda c_3(\lambda + \alpha)(\lambda + 2\alpha)]}{(\gamma + a_0)[(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)] - \mu(\lambda + 2\alpha)(\gamma + a_2)}$$

$$\times \int_0^\infty \mu_j(x)e^{-x}\int_0^\infty \mu_i(x)dxds$$

$$+ \frac{\lambda c_3[(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)] + \lambda h_2[(\gamma + a_1)(\gamma + a_2) + \lambda c_3(\lambda + \alpha)(\lambda + 2\alpha)]}{(\gamma + a_0)[(\gamma + a_1)(\gamma + a_2) - \mu(\lambda + \alpha)] - \mu(\lambda + 2\alpha)(\gamma + a_2)}$$

$$\times \int_0^\infty \mu_j(x)e^{-x}\int_0^\infty \mu_i(x)dxds.$$
∥

Proof.

From Theorems 8.4, 8.5, and 8.6, the abstract Cauchy problem

\[ \begin{align*}
\text{Theorem 8.4.} & \quad \text{The operator } (A, D(A)) \text{ generates a positive contraction } C_0\text{-semigroup } (T(t))_{t \geq 0}. \\
\text{Theorem 8.5.} & \quad \text{For a closed operator } (A, D(A)) \text{ on } X \text{ the associated abstract Cauchy problem } (ACP) \\
& \quad \text{is well-posed if and only if } (A, D(A)) \text{ generates a strongly continuous semigroup on } X.
\end{align*} \]

From Theorem 8.5 and [6, Proposition II.6.2] we can state our main result.

\textbf{Theorem 8.6.} The system \((R), (BC), \text{ and } (IC_0)\) has a unique solution \(p(x, t)\) which satisfies \(\|p(\cdot, t)\| = 1, t \in [0, \infty)\).

\textit{Proof.} From Theorems 8.4, 8.5, and [6, Proposition II.6.2] we obtain that the associated abstract Cauchy problem \((ACP)\) has a unique positive time-dependent solution \(p(x, t)\) which can be expressed as

\[
p(x, t) = T(t)p(0) = T(t)(1, 0, 0, 0, 0, 0). \tag{4.26}
\]
Let $P(t) = p(x, t) = (p_0(t), p_1, p_2, p_3(x, t), p_4(x, t), p_5(x, t))$, then $P(t)$ satisfies the system of equations

\[
\begin{align*}
\frac{dp_0(t)}{dt} &= -a_0 p_0(t) + \mu p_1(t) + \sum_{i=3}^{5} \int_0^\infty \mu_i(x) p_i(x, t) dx, \\
\frac{dp_1(t)}{dt} &= (\lambda + 2\alpha) p_0(t) - a_1 p_1(t) + \mu p_2(t), \\
\frac{dp_2(t)}{dt} &= (\lambda + \alpha) p_1(t) - a_2 p_2(t), \\
\frac{\partial p_3(x, t)}{\partial t} &= -\frac{\partial p_3(x, t)}{\partial x} - \mu_3(x) p_3(x, t), \\
\frac{\partial p_4(x, t)}{\partial t} &= -\frac{\partial p_4(x, t)}{\partial x} - \mu_4(x) p_4(x, t), \\
\frac{\partial p_5(x, t)}{\partial t} &= -\frac{\partial p_5(x, t)}{\partial x} - \mu_5(x) p_5(x, t), \\
p_3(0, t) &= \lambda p_2(t), \quad t > 0, \\
p_4(0, t) &= \sum_{i=0}^{2} \lambda_c_i p_i(t), \quad t > 0, \\
p_5(0, t) &= \sum_{i=0}^{2} \lambda_b_i p_i(t), \quad t > 0, \\
P(0) &= (1, 0, 0, 0, 0).
\end{align*}
\]  

Since

\[
\int_0^\infty \frac{\partial p_j(x, t)}{\partial x} dx = p_j(\infty, t) - p_j(0, t) = -p_j(0, t), \quad j = 3, 4, 5.
\]  

Using (4.27)-(4.28) we compute

\[
\begin{align*}
\frac{d\|P(t)\|}{dt} &= \sum_{i=0}^{2} \frac{dp_i(t)}{dt} + \sum_{j=3}^{5} \int_0^\infty \frac{\partial p_j(x, t)}{\partial t} dx \\
&= -a_0 p_0(t) + \mu p_1(t) + \sum_{j=3}^{5} \int_0^\infty \mu_i(x) p_i(x, t) dx, \\
&\quad + (\lambda + 2\alpha) p_0(t) - a_1 p_1(t) + \mu p_2(t) + (\lambda + \alpha) p_1(t) - a_2 p_2(t), \\
&\quad + \sum_{j=3}^{5} \int_0^\infty \left[-\frac{\partial p_j(x, t)}{\partial x} - \mu_j(x) p_j(x, t)\right] dx
\end{align*}
\]
\[ (-a_0 + \lambda + 2\alpha)p_0(t) + (\mu - a_1 + \lambda + \alpha) + (\mu - a_2)p_2(t) + \sum_{j=3}^{5} p_j(0,t) \]
\[ = -\sum_{j=3}^{5} p_j(0,t) + \sum_{j=3}^{5} p_j(0,t) = 0. \]  
(4.29)

By (4.26) and (4.29) we obtain
\[ \frac{d\|T(t)P(0)\|}{dt} = 0. \]  
(4.30)

Therefore,
\[ \|T(t)P(0)\| = \|P(t)\| = \|P(0)\| = 1. \]  
(4.31)

This shows \(\|p(\cdot, t)\| = 1\), for all \(t \in [0, \infty)\). \(\square\)

5. Asymptotic Stability of the Solution

In this section, we prove the asymptotic stability of the system by using \(C_0\)-semigroup theory. First we express the resolvent of \(A\) in terms of the resolvent of \(A_0\), the Dirichlet operator \(D\), and the boundary operator \(\Phi\), compare with [10].

Lemma 8.1. Let \(\gamma \in \rho(A_0) \cap \rho(A)\). Then
\[ R(\gamma, A) = R(\gamma, A_0) + D(\gamma I - \Phi D)\Phi R(\gamma, A_0). \]  
(5.1)

Proof. Under our assumption, we see from the Characteristic Equation 3.8 that \(1 \notin \sigma(\Phi D)\) and it follows from the Proof that \(\gamma - \mathcal{A}\) is invertible with inverse
\[ R(\gamma, \mathcal{A}) = (\gamma - \mathcal{A})^{-1}(\mathcal{A} - \mathcal{BR}(\gamma, \mathcal{A}_0))^{-1}. \]  
(5.2)

Using the explicit representation (3.28) for \(\mathcal{A} - \mathcal{BR}(\gamma, \mathcal{A}_0)\) we compute
\[ (\mathcal{A} - \mathcal{BR}(\gamma, \mathcal{A}_0))^{-1} = \begin{pmatrix} \Phi R(\gamma, A_0) & 1dX \\ 0 & (1dX - \Phi D)\Phi R(\gamma, A_0) \end{pmatrix}. \]  
(5.3)

Define \(R(\gamma) := (1dX + D(1dX - \Phi D)\Phi R(\gamma, A_0).\) Then
\[ R(\gamma, \mathcal{A}) = \begin{pmatrix} R(\gamma) & D(1dX - \Phi D) \Phi \\ 0 & 0 \end{pmatrix}. \]  
(5.4)
Since
\[
\begin{pmatrix}
R(\gamma) & 0 \\
0 & 0
\end{pmatrix} = R(\gamma, \mathcal{A}|_{\mathcal{X}_0}) = R(\gamma, \mathcal{A}|_{\mathcal{X}_0})
\] (5.5)
and since \( A \equiv \mathcal{A}|_{\mathcal{X}_0} \), it follows that
\[
R(\gamma, A) = R(\gamma).
\] (5.6)

The above representation for the resolvent of \( A_0 \) shows that it is a positive operator for \( \gamma > 0 \). This property is very useful in the following lemma to prove the irreducibility of the semigroup generated by \( A \). For the notation and terminology concerning positive operators we refer to the books [8, 15].

**Lemma 8.2.** The semigroup \((T(t))_{t \geq 0}\) generated by \((A, D(A))\) is irreducible.

**Proof.** We know from [8, Definition C-III 3.1] that the irreducibility of \((T(t))_{t \geq 0}\) is equivalent to the existence of \( \gamma > 0 \) such that \( 0 < p \in X \) implies \( R(\gamma, A)p \gg 0 \). We now suppose that \( \gamma > 0 \) and \( 0 < p \in X \). Then also \( R(\gamma, A_0)p > 0 \) and \( \Phi R(\gamma, A_0)p > 0 \). It follows from the proof of Lemma 8.3 that \( \| \Phi D_\gamma \| < 1 \) for all \( \gamma > 0 \). Hence the inverse of \( \text{Id}_\partial X - \Phi D_\gamma \) can be computed via the Neumann series
\[
(Id_\partial X - \Phi D_\gamma)^{-1} = \sum_{n=0}^{\infty} (\Phi D_\gamma)^n.
\] (5.7)

We know from the form of \( \Phi D_\gamma \) that for every \( i \in \{1, 2, 3\} \) there exists \( k \in \mathbb{N} \) such that the real number \((\Phi D_\gamma)^k \Phi R(\gamma, A_0)p > 0\). Therefore,
\[
(Id_\partial X - \Phi D_\gamma)^{-1} \Phi R(\gamma, A_0)p \gg 0,
\] (5.8)
and by the form of \( D_\gamma \) we have
\[
D_\gamma (Id_\partial X - \Phi D_\gamma)^{-1} \Phi R(\gamma, A_0)p \gg 0.
\] (5.9)

This implies
\[
R(\gamma, A)p \gg 0,
\] (5.10)
and hence \((T(t))_{t \geq 0}\) is irreducible.

We now use the information obtained on \( \sigma(A) \cap i\mathbb{R} \) and on \((T(t))_{t \geq 0}\) to prove our main result on the asymptotic behaviour of the solutions of \((ACP)\). We first show that the
semigroup is relatively weakly compact, see [6, Section V.2.b], and then we argue as in [16, 17]. Denote by

\[ \text{fix}(T(t))_{t \geq 0} := \bigcap_{t \geq 0} \text{fix}(T(t)) = \{ p \in X : T(t)p = p \ \forall t \geq 0 \}. \] (5.11)

According to [6, Corollary IV.3.8(i)] we have the equality

\[ \text{fix}(T(t))_{t \geq 0} = \ker A. \] (5.12)

To study the asymptotic behaviour of the semigroup \((T(t))_{t \geq 0}\) the following compactness property is useful.

**Lemma 8.3.** The set \(\{ T(t) : t \geq 0 \} \subseteq \mathcal{L}(X)\) is relatively compact for the weak operator topology. In particular, it is mean ergodic, that is,

\[ \lim_{r \to \infty} \frac{1}{r} \int_0^r T(s)p \, ds \] (5.13)

exists for all \(p \in X\).

**Proof.** From \(0 \in \sigma_p(B)\) and (5.12) it follows that there exists \(0 \neq p \in \text{fix}(T(t))_{t \geq 0}\). By the positivity of the semigroup we have

\[ |p| = |T(t)p| \leq T(t)|p| \ \forall t \geq 0. \] (5.14)

Suppose that \(|p| < T(t)|p|\). Since \((T(t))_{t \geq 0}\) is a contraction semigroup and the norm on \(X\) is strictly monotone, we obtain that

\[ \|p\| < \|T(t)|p|\| \leq \|p\|, \] (5.15)

which is a contradiction. Thus

\[ |p| = T(t)|p| \] (5.16)

holds, and we can already assume that \(p > 0\). Since \((T(t))_{t \geq 0}\) is irreducible, we obtain from [8, Proposition C-III 3.5(a)] that \(p\) is a quasi-interior point of \(X\) which implies that

\[ X_p := \bigcup_{n \geq 1} [-np, np] \] (5.17)

is dense in \(X\). Let \(n \in \mathbb{N}\) and take \(w \in [-np, np]\), that is, \(-np \leq w \leq np\). Then

\[ -np = -nT(t)p \leq T(t)w \leq nT(t)p = np \ \forall t \geq 0. \] (5.18)
Since the order interval \([-np, np]\) is weakly compact in \(X\), see [15, page 92], the orbit \(\{T(t)w : t \geq 0\}\) is relatively weakly compact in \(X\). So far, we have shown that the orbits of elements \(w \in X_p\) are relatively weakly compact. Since the semigroup \((T(t))_{t \geq 0}\) is bounded and \(X_p\) is dense in \(X\), we know from [6, Lemma V.2.7] that \(\{T(t) : t \geq 0\} \subseteq \mathcal{L}(X)\) is relatively weakly compact. By [6, Lemma V.2.7] we obtain that the semigroup \((T(t))_{t \geq 0}\) is mean ergodic. \(\square\)

We can now show the convergence of the semigroup to a one-dimensional equilibrium point.

**Theorem 8.4.** The space \(X\) can be decomposed into the direct sum

\[
X = X_1 \oplus X_2,
\]

where \(X_1 = \text{fix}(T(t))_{t \geq 0} = \ker A\) is one dimensional and spanned by a strictly positive eigenvector \(\tilde{p} \in \ker A\) of \(A\). In addition, the restriction \((T(t)|_{X_1})_{t \geq 0}\) is strongly stable.

**Proof.** Since by Lemma 8.3 every \(p \in X\) has a relatively weakly compact orbit, \((T(t))_{t \geq 0}\) is totally ergodic; see [18, Proposition 4.3.12]. This implies that \(X\) can be decomposed into

\[
X = \ker A \oplus \overline{\text{rg}(A)} = X_1 \oplus X_2,
\]

where \(\ker A = \text{fix}(T(t))_{t \geq 0}\) and \(X_1\) and \(X_2\) are invariant under \((T(t))_{t \geq 0}\); see [6, Lemma V.4.4]. There exists \(\tilde{p} \in \ker A\) such that \(\tilde{p} > 0\); see the proof of Lemma 8.3. Moreover, by the same construction as in the proof of [6, Lemma V.2.20(i)], we find \(p' \in X'\) such that \(p' > 0\) and \(A'p' = 0\). Hence we obtain that

\[
\dim \ker A = 1,
\]

and that \(\tilde{p}\) is strictly positive, that is, \(\tilde{p} \gg 0\); see [8, Proposition C-III 3.5].

We now consider the generator \((A_2, D(A_2))\) of the restricted semigroup \((T_2(t))_{t \geq 0}\), where

\[
A_2 v = Av, \quad D(A_2) = D(A) \cap X_2,
\]

and \(T_2(t) = T(t)|_{X_2}\). Clearly, \((T_2(t))_{t \geq 0}\) is bounded and totally ergodic on \(X_2\); that is, \((e^{-iat}T(t))_{t \geq 0}\) is mean ergodic for all \(a \in \mathbb{R}\). This implies that \(\ker(A_2 - iat)\) separates \(\ker(A_2' - iat)\) for all \(a \in \mathbb{R}\); see [6, Theorem V.4.5]. By Lemma 8.9 \(\ker(A_2 - iat) = \{0\}\), thus \(\ker(A_2' - iat) = \{0\}\) for all \(a \in \mathbb{R}\). Hence it follows that \(\sigma_p(A_2') \cap \mathbb{R} = \emptyset\). Applying the Arendt-Batty-Lyubich-Vu Theorem, see [18, Theorem 5.5.5], we obtain the strong stability of \((T_2(t))_{t \geq 0}\). \(\square\)

Combining Lemmas 8.8, 8.9, and 8.3 with Theorem 8.4 we obtain the following main result.
Corollary 8.5. There exists \( p' \in X', p' \gg 0 \), such that for all \( p \in X \)

\[
\lim_{t \to \infty} T(t)p = \langle p', p \rangle \bar{p},
\]

where \( \ker A = \langle \bar{p} \rangle, \bar{p} \gg 0 \).

Since the semigroup gives the solutions of the original system, we obtain our final result.

Corollary 8.6. The time-dependent solution of the system \((R), (BC),\) and \((IC_0)\) converges strongly to the steady-state solution as time tends to infinite, that is, \( \lim_{t \to \infty} p(\cdot, t) = \alpha \bar{p} \), where \( \alpha > 0 \) and \( \bar{p} \) as in Corollary 8.5.

6. Conclusions

In this paper, we considered a repairable system involving primary as well as secondary failures. By using the \( C_0 \)-semigroup theory of bounded linear operator on Banach space, we proved that the corresponding dynamic operator generates positive contractive \( C_0 \)-semigroup and the system is well-posed. Furthermore, we proved the existence of positive solution of the system. Moreover, we obtained the result on the asymptotic stability of the solution of this system, that is, the convergences to a one-dimensional equilibrium. The proof is based on the Arendt-Batty-Lyubich-Vu Theorem [18, Theorem 5.5.5].
