The purpose of the present paper is to establish some new results giving the sharp bounds of the real parts of ratios of harmonic univalent functions to their sequences of partial sums by using convolution. Relevant connections of the results presented here with various known results are briefly indicated.

1. Introduction

A continuous complex-valued function \( f = u + iv \) is said to be harmonic in a simply connected domain \( D \) if both \( u \) and \( v \) are real harmonic in \( D \). In any simply-connected domain we can write \( f = h + g \), where \( h \) and \( g \) are analytic in \( D \). We call \( h \) the analytic part and \( g \) the co-analytic part of \( f \). A necessary and sufficient condition for \( f \) to be locally univalent and sense-preserving in \( D \) is that \( |h'(z)| > |g'(z)|, \ z \in D \), see [1]. For more basic results on harmonic functions one may refer to the following standard text book by Duren [2]. See also Ahuja [3] and Ponnusamy and Rasila ([4, 5]).

Denote by \( SH \) the class of functions \( f = h + g \) which are harmonic univalent and sense-preserving in the open unit disk \( U = \{ z : |z| < 1 \} \) for which \( f(0) = f_z(0) - 1 = 0 \). Then for \( f = h + g \in SH \) we may express the analytic functions \( h \) and \( g \) as

\[
h(z) = z + \sum_{k=2}^{\infty} a_k z^k, \quad g(z) = \sum_{k=1}^{\infty} b_k z^k, \quad |b_1| < 1. \tag{1.1}
\]
Note that $S_H$ reduces to the class $S$ of normalized analytic univalent functions, if the coanalytic part of its member is zero, that is, $g \equiv 0$, and for this class $f(z)$ may be expressed as

$$f(z) = z + \sum_{k=2}^{\infty} a_k z^k.$$  

(1.2)

Let $\phi(z) \in S_H$ be a fixed function of the form

$$\phi(z) = z + \sum_{k=2}^{\infty} c_k z^k + \sum_{k=1}^{\infty} d_k z^k, \quad (d_k \geq c_k \geq c_2 > 0; \ k \geq 2, \ |d_1| < 1).$$  

(1.3)

Now, we introduce a class $S_H(c_k, d_k, \delta)$ consisting of functions of the form (1.1) which satisfies the inequality

$$\sum_{k=2}^{\infty} c_k |a_k| + \sum_{k=1}^{\infty} d_k |b_k| \leq \delta, \quad \text{where} \ \delta > 0,$$

and we note that if $d_k = 0$, then the class $S_H(c_k, d_k, \delta)$ reduces to the class $S_\delta(c_k, \delta)$ which was introduced by Frasin [6]. In this case the condition (1.4) reduces to

$$\sum_{k=2}^{\infty} c_k |a_k| \leq \delta, \quad \text{where} \ \delta > 0.$$  

(1.5)

It is easy to see that various subclasses of $S_H$ consisting of functions $f(z)$ of the form (1.1) can be represented as $S_H(c_k, d_k, \delta)$ for suitable choices of $c_k, d_k,$ and $\delta$ studied earlier by various researchers. For example:

1. $S_H(k, k, 1) \equiv S_H^* \equiv K_H$ studied by Silverman [7]; Silverman and Silvia [8].
2. $S_H(k - \alpha, k + \alpha, 1 - \alpha) \equiv S_H^*(\alpha)$ studied by Jahangiri [9].
3. $S_H((k - \alpha)(\phi(k, \lambda)), (k + \alpha)(\phi(k, \lambda)), 1 - \alpha) \equiv S_{H, \lambda}^*(\alpha)$ studied by Dixit and Porwal [10].
4. $S_H(k^m - ak^n, k^m - ak^n, 1 - \alpha) \equiv HS(m, n, \alpha)$ studied by Dixit and Porwal [11].
5. $S_H(k, k, \beta - 1) \equiv H_P(\beta)$ studied by Dixit and Porwal [12].
6. $S_H(\lambda k(1 - \alpha), -\alpha(1 - \lambda), k(1 - \alpha) + \alpha(1 - \lambda), 1 - \alpha) \equiv S_H(\Phi, \Psi, \alpha, \lambda)$ studied by Dixit and Porwal [13].
7. $S_H(\lambda k - \alpha, \mu_k + \alpha, 1 - \alpha) \equiv S_H(\Phi, \Psi, \alpha)$ studied by Frasin [14].
8. $S_H(k(1 - \alpha) - \alpha(1 - \lambda), k(1 - \alpha) + \alpha(1 - \lambda), 1 - \alpha) \equiv S_H^*(\alpha, \lambda)$ studied by Öztürk et al. [15].
9. $S_H((k(\beta + 1) - t(\beta + \gamma))\Gamma(\alpha_1, k), (k(\beta + 1) + t(\beta + \gamma))\Gamma(\alpha_1, k), (k - 1)! (1 - \alpha)) \equiv G_{H, \alpha}(\alpha_1, \beta, \gamma, t)$ studied by Porwal et al. [16].
10. $S_H(2k - 1 - \alpha, 2k + 1 + \alpha, 1 - \alpha) \equiv G_{H, \alpha}(\alpha)$ studied by Rosy et al. [17].
In 1985, Silvia [18] studied the partial sums of convex functions of order $\alpha$. Later on, Silverman [19], Afaf et al. [20], Dixit and Porwal [21], Frasin ([6, 22]), Murugusundaramoorthy et al. [23], Owa et al. [24], Porwal and Dixit [25], Raina and Bansal [26] and Rosy et al. [27] studied and generalized the results on partial sums for various classes of analytic functions. Very recently, Porwal [28], Porwal and Dixit [29] studied analogues interesting results on the partial sums of certain harmonic univalent functions. In this work, we extend all these results.

Now, we let the sequences of partial sums of function of the form (1.1) with $b_1 = 0$ be

$$f_m(z) = z + \sum_{k=2}^{m} a_k z^k + \sum_{k=2}^{\infty} b_k z^k,$$

$$f_n(z) = z + \sum_{k=2}^{\infty} a_k z^k + \sum_{k=2}^{n} b_k z^k,$$

$$f_{m,n}(z) = z + \sum_{k=2}^{m} a_k z^k + \sum_{k=2}^{n} b_k z^k,$$

(1.6)

when the coefficients of $f$ are sufficiently small to satisfy the condition (1.4).

In the present paper, we determine sharp lower bounds for $\text{Re}((f(z) \ast g(z))/(f_m(z) \ast g(z)))$, $\text{Re}((f_2(z) \ast g(z))/(f_2(z) \ast g(z)))$, $\text{Re}((f(z) \ast g(z))/(f_n(z) \ast g(z)))$, $\text{Re}((f(z) \ast g(z))/(f_m(z) \ast g(z)))$, $\text{Re}((f(z) \ast g(z))/(f_{m,n}(z) \ast g(z)))$, and $\text{Re}((f(z) \ast g(z))/(f(z) \ast g(z)))$ where $f_m(z)$, $f_n(z)$ and $f_{m,n}(z)$ are defined above and $g(z) = z + \sum_{k=2}^{\infty} \lambda_k z^k + \sum_{k=2}^{\infty} \mu_k z^k$, $(\lambda_k \geq 0, \mu_k \geq 0)$ is a harmonic function and the operator “$\ast$” stands for the Hadamard product or convolution of two power series, which is defined for two functions $f(z)$ and $g(z)$ are of the form

$$f(z) = z + \sum_{k=2}^{\infty} a_k z^k + \sum_{k=2}^{\infty} b_k z^k,$$

$$g(z) = z + \sum_{k=2}^{\infty} c_k z^k + \sum_{k=2}^{\infty} d_k z^k,$$

(1.7)

as

$$(f \ast g)(z) = f(z) \ast g(z) = z + \sum_{k=2}^{\infty} a_k c_k z^k + \sum_{k=2}^{\infty} b_k d_k z^k.$$

(1.8)

It is worthy to note that this study not only gives as a particular case, the results of Porwal [28], Porwal and Dixit [29], but also give rise to several new results.

2. Main Results

In our first theorem, we determine sharp lower bounds for $\text{Re}((f(z) \ast g(z))/(f_m(z) \ast g(z)))$. 
Theorem 2.1. If \( f \) of the form (1.1) with \( b_1 = 0 \), satisfies the condition (1.4), then

\[
\text{Re} \left\{ \frac{f(z) \ast q(z)}{f_m(z) \ast q(z)} \right\} \geq \frac{c_{m+1} - \lambda_{m+1} \delta}{c_{m+1}}, \quad (z \in U), \tag{2.1}
\]

where

\[
c_k \geq \begin{cases} 
\lambda_k \delta & \text{if } k = 2, 3, \ldots, m, \\
\frac{\lambda_k c_{m+1}}{\lambda_{m+1}} & \text{if } k = m+1, m+2, \ldots.
\end{cases} \tag{2.2}
\]

The result (2.1) is sharp with the function given by

\[
f(z) = z + \frac{\delta}{c_{m+1}} z^{m+1}, \tag{2.3}
\]

where \( 0 < \delta \leq c_{m+1}/\lambda_{m+1} \).

Proof. To obtain sharp lower bound given by (2.1), let us put

\[
\frac{1 + \omega(z)}{1 - \omega(z)} = \frac{c_{m+1}}{\lambda_{m+1} \delta} \left[ \frac{f(re^{i\theta}) \ast q(re^{i\theta})}{f_m(re^{i\theta}) \ast q(re^{i\theta})} - \frac{c_{m+1} - \lambda_{m+1} \delta}{c_{m+1}} \right] + \sum_{k=2}^{m} \lambda_k a_k r^{k-1} e^{i(k-1)\theta} \left( \sum_{k=2}^{m} \mu_k b_k r^{k-1} e^{-i(k+1)\theta} \right) + \sum_{k=m+1}^{\infty} \lambda_k a_k r^{k-1} e^{i(k-1)\theta} \left( \sum_{k=2}^{m} \mu_k b_k r^{k-1} e^{-i(k+1)\theta} + \sum_{k=m+1}^{\infty} \mu_k b_k r^{k-1} e^{-i(k+1)\theta} \right)
\]

So that

\[
\omega(z) = \frac{\mathcal{R} \left[ \sum_{k=m+1}^{\infty} \lambda_k a_k r^{k-1} e^{i(k-1)\theta} \right]}{2 + 2 \left( \sum_{k=2}^{m} \lambda_k a_k r^{k-1} e^{i(k-1)\theta} + \sum_{k=2}^{m} \mu_k b_k r^{k-1} e^{-i(k+1)\theta} + \sum_{k=m+1}^{\infty} \lambda_k a_k r^{k-1} e^{i(k-1)\theta} \right) + \mathcal{R} \left( \sum_{k=m+1}^{\infty} \lambda_k a_k r^{k-1} e^{i(k-1)\theta} \right)}
\]

where \( \mathcal{R} \) denotes \((c_{m+1}/\lambda_{m+1} \delta)\).
Then

$$|\omega(z)| \leq \frac{(c_{m+1}/\lambda_{m+1}\delta)\left[\sum_{k=m+1}^{\infty} \lambda_k |a_k|\right]}{2 - 2(\sum_{k=2}^{m} \lambda_k |a_k| + \sum_{k=2}^{\infty} \mu_k |b_k|) - (c_{m+1}/\lambda_{m+1}\delta)(\sum_{k=m+1}^{\infty} \lambda_k |a_k|)}.$$  \hspace{1cm} (2.6)

This last expression is bounded above by 1, if and only if

$$\sum_{k=2}^{m} \lambda_k |a_k| + \sum_{k=2}^{\infty} \mu_k |b_k| + c_{m+1}/\lambda_{m+1}\delta \left(\sum_{k=m+1}^{\infty} \lambda_k |a_k|\right) \leq 1. \hspace{1cm} (2.7)$$

It suffices to show that L.H.S. of (2.7) is bounded above by $\sum_{k=2}^{\infty} (c_k / \delta) |a_k| + \sum_{k=2}^{\infty} (d_k / \delta) |b_k|$, which is equivalent to

$$\sum_{k=2}^{m} c_k \lambda_k \delta/\delta |a_k| + \sum_{k=2}^{\infty} d_k \mu_k \delta/\delta |b_k| + \sum_{k=m+1}^{\infty} c_k \lambda_{m+1} \lambda_k - c_{m+1} \lambda_k |a_k| \geq 0. \hspace{1cm} (2.8)$$

To see that $f(z) = z + (\delta/c_{m+1})z^{m+1}$ gives the sharp result, we observe that for $z = re^{i\pi/m}$ that

$$\frac{f(z) \ast \psi(z)}{f_m(z) \ast \psi(z)} = 1 + \frac{\lambda_{m+1}\delta}{c_{m+1}} z^m \rightarrow 1 - \frac{\lambda_{m+1}\delta}{c_{m+1}} = \frac{c_{m+1} - \lambda_{m+1}\delta}{c_{m+1}}, \hspace{1cm} (2.9)$$

when $r \rightarrow 1^{-}$. \hspace{1cm} \square

We next determine bounds for Re$\{ (f_m(z) \ast \psi(z)) / (f(z) \ast \psi(z)) \}$.

**Theorem 2.2.** If $f$ of the form (1.1) with $b_1 = 0$, satisfies the condition (1.4), then

$$\text{Re} \left\{ \frac{f_m(z) \ast \psi(z)}{f(z) \ast \psi(z)} \right\} \geq \frac{c_{m+1}}{c_{m+1} + \lambda_{m+1}\delta}, \quad (z \in U), \hspace{1cm} (2.10)$$

where

$$c_k \geq \begin{cases} \frac{\lambda_k \delta}{\lambda_{m+1}} & \text{if } k = 2, 3, \ldots, m \\ \frac{\lambda_k c_{m+1}}{\lambda_{m+1}} & \text{if } k = m + 1, m + 2, \ldots. \end{cases} \hspace{1cm} (2.11)$$

The result (2.10) is sharp with the function given by (2.3).
Proof. To prove Theorem 2.2, we may write

$$\frac{1 + \omega(z)}{1 - \omega(z)} = \frac{c_{m+1} + \lambda_{m+1} \delta}{\lambda_{m+1} \delta} \left[ f_m(z) * \psi(z) - \frac{c_{m+1}}{c_{m+1} + \lambda_{m+1} \delta} \right]$$

$$= 1 + \sum_{k=2}^{m} \lambda_k a_k r^{k-1} e^{i(k-1)\theta} + \sum_{k=2}^{\infty} \mu_k b_k r^{k-1} e^{i(k-1)\theta} - (c_{m+1} / \lambda_{m+1} \delta) \left[ \sum_{k=m+1}^{\infty} \lambda_k a_k r^{k-1} e^{i(k-1)\theta} \right]$$

$$= 1 + \sum_{k=2}^{m} \lambda_k a_k r^{k-1} e^{i(k-1)\theta} + \sum_{k=2}^{\infty} \mu_k b_k r^{k-1} e^{i(k-1)\theta} - (c_{m+1} / \lambda_{m+1} \delta) \left[ \sum_{k=m+1}^{\infty} \lambda_k a_k r^{k-1} e^{i(k-1)\theta} \right],$$

(2.12)

where

$$|\omega(z)| \leq \frac{((c_{m+1} + \lambda_{m+1} \delta) / \lambda_{m+1} \delta) \left[ \sum_{k=m+1}^{\infty} \lambda_k |a_k| \right]}{2 - 2 \left( \sum_{k=2}^{m} \lambda_k |a_k| + \sum_{k=2}^{\infty} |b_k| \right) - (c_{m+1} - \lambda_{m+1} \delta) \left( \sum_{k=m+1}^{\infty} \lambda_k |a_k| \right)} \leq 1.$$

(2.13)

This last inequality is equivalent to

$$\sum_{k=2}^{m} \lambda_k |a_k| + \sum_{k=2}^{\infty} |b_k| + \frac{c_{m+1}}{\lambda_{m+1} \delta} \left( \sum_{k=m+1}^{\infty} \lambda_k |a_k| \right) \leq 1.$$

(2.14)

Since the L.H.S. of (2.14) is bounded above by $\sum_{k=2}^{\infty} (c_k / \delta)|a_k| + \sum_{k=2}^{\infty} (d_k / \delta)|b_k|$, the proof is evidently complete. \( \square \)

Adopting the same procedure as in Theorems 2.1 and 2.2 and performing simple calculations, we can obtain the sharp lower bounds for the real parts of the following ratios:

$$\text{Re} \left\{ \frac{(f(z) * \psi(z))}{(f_n(z) * \psi(z))} \right\}, \quad \text{Re} \left\{ \frac{(f_n(z) * \psi(z))}{(f(z) * \psi(z))} \right\}, \quad \text{Re} \left\{ \frac{(f(z) * \psi(z))}{(f_m(z) * \psi(z))} \right\},$$

$$\text{Re} \left\{ \frac{(f_m(z) * \psi(z))}{(f(z) * \psi(z))} \right\}. \quad (2.15)$$

The results corresponding to real parts of these ratios are contained in the following Theorems 2.3, 2.4, 2.5, and 2.6.

**Theorem 2.3.** If $f$ of the form (1.1) with $b_1 = 0$ satisfies the condition (1.4), then

$$\text{Re} \left\{ \frac{f(z) * \psi(z)}{f_n(z) * \psi(z)} \right\} \geq \frac{d_{n+1} - \mu_{n+1} \delta}{d_{n+1}}, \quad (z \in U),$$

(2.16)
where
\[ d_k \geq \begin{cases} \frac{\mu_k \delta}{\mu_{n+1}} & \text{if } k = 2, 3, \ldots, n, \\ \frac{\mu_k d_{n+1}}{\mu_{n+1}} & \text{if } k = n + 1, n + 2, \ldots \end{cases} \tag{2.17} \]

The result (2.16) is sharp with the function
\[ f(z) = z + \frac{\delta}{d_{n+1}} z^{n+1}. \tag{2.18} \]

**Theorem 2.4.** If \( f \) of the form (1.1) with \( b_1 = 0 \), satisfies the condition (1.4), then
\[ \Re \left\{ \frac{f_n(z) * \psi(z)}{f(z) * \psi(z)} \right\} \geq \frac{d_{n+1}}{d_{n+1} + \mu_{n+1} \delta}, \quad (z \in U), \tag{2.19} \]
where
\[ d_k \geq \begin{cases} \frac{\mu_k \delta}{\mu_{n+1}} & \text{if } k = 2, 3, \ldots, n, \\ \frac{\mu_k d_{n+1}}{\mu_{n+1}} & \text{if } k = n + 1, n + 2, \ldots \end{cases} \tag{2.20} \]

The result (2.19) is sharp with the function given by (2.18).

**Theorem 2.5.** If \( f \) of the form (1.1) with \( b_1 = 0 \), satisfies the condition (1.4), then
(i)
\[ \Re \left\{ \frac{f(z) * \psi(z)}{f_{m,n}(z) * \psi(z)} \right\} \geq \frac{c_{m+1} - \frac{\lambda_{m+1} \delta}{c_{m+1}}}{d_{n+1}}, \quad (z \in U), \tag{2.21} \]
where
\[ c_k \geq \begin{cases} \frac{\lambda_k \delta}{\lambda_{m+1}} & \text{if } k = 2, 3, \ldots, m, \\ \frac{\lambda_k c_{m+1}}{\lambda_{m+1}} & \text{if } k = m + 1, m + 2, \ldots \end{cases} \tag{2.22} \]
\[ d_k \geq \begin{cases} \frac{\lambda_k \delta}{\lambda_{m+1}} & \text{if } k = 2, 3, \ldots, m, \\ \frac{\lambda_k c_{m+1}}{\lambda_{m+1}} & \text{if } k = m + 1, m + 2, \ldots \end{cases} \]

(ii)
\[ \Re \left\{ \frac{f(z) * \psi(z)}{f_{m,n}(z) * \psi(z)} \right\} \geq \frac{d_{n+1} - \mu_{n+1} \delta}{d_{n+1}} \cdot (z \in U), \tag{2.23} \]
where

\[ c_k \geq \begin{cases} 
\mu_k \delta & \text{if } k = 2, 3, \ldots, n, \\
\frac{\mu_k d_{n+1}}{\mu_{n+1}} & \text{if } k = n + 1, n + 2 \ldots,
\end{cases} \]  
(2.24)

\[ d_k \geq \begin{cases} 
\mu_k \delta & \text{if } k = 2, 3, \ldots, n, \\
\frac{\mu_k d_{n+1}}{\mu_{n+1}} & \text{if } k = n + 1, n + 2 \ldots.
\end{cases} \]

The results (2.21) and (2.23) are sharp with the functions given by (2.3) and (2.18), respectively.

**Theorem 2.6.** If \( f \) of the form (1.1) with \( b_1 = 0 \), satisfies condition (1.4), then

(i)

\[ \text{Re} \left\{ \frac{f_{m,n}(z) \ast \varphi(z)}{f(z) \ast \varphi(z)} \right\} \geq \frac{c_{m+1}}{c_{m+1} + \lambda_{m+1} \delta}, \quad (z \in U), \]  
(2.25)

where

\[ c_k \geq \begin{cases} 
\lambda_k \delta & \text{if } k = 2, 3, \ldots, m, \\
\frac{\lambda_k c_{m+1}}{\lambda_{m+1}} & \text{if } k = m + 1, m + 2 \ldots,
\end{cases} \]  
(2.26)

\[ d_k \geq \begin{cases} 
\lambda_k \delta & \text{if } k = 2, 3, \ldots, m, \\
\frac{\lambda_k c_{m+1}}{\lambda_{m+1}} & \text{if } k = m + 1, m + 2 \ldots.
\end{cases} \]

(ii)

\[ \text{Re} \left\{ \frac{f_{m,n}(z) \ast \varphi(z)}{f(z) \ast \varphi(z)} \right\} \geq \frac{d_{n+1}}{d_{n+1} + \mu_{n+1} \delta}, \quad (z \in U), \]  
(2.27)

where

\[ c_k \geq \begin{cases} 
\mu_k \delta & \text{if } k = 2, 3, \ldots, m, \\
\frac{\mu_k d_{n+1}}{\mu_{n+1}} & \text{if } k = m + 1, m + 2 \ldots,
\end{cases} \]  
(2.28)

\[ d_k \geq \begin{cases} 
\mu_k \delta & \text{if } k = 2, 3, \ldots, n, \\
\frac{\mu_k d_{n+1}}{\mu_{n+1}} & \text{if } k = n + 1, n + 2 \ldots.
\end{cases} \]
3. Some Consequences and Concluding Remarks

In this section, we specifically point out the relevances of some of our main results with those results which have appeared recently in literature.

If we put \( \varphi(z) = (z/(1 - z)) + ((z/(1 - z)) - z) \) and \( \varphi(z) = (z/(1 - z)^2) + ((z/(1 - z)^2) - z) \) in Theorems 2.1–2.6, then we obtain the corresponding results of Porwal [28].

Next, if we put \( \varphi(z) = (z/(1 - z)) + ((z/(1 - z)) - z) \), \( \varphi(z) = (z/(1 - z)^2) + ((z/(1 - z)^2) - z) \), \( c_k = k - \alpha, d_k = k + \alpha \), and \( \delta = 1 - \alpha \) in Theorems 2.1–2.6, then we obtain the corresponding results of Dixit and Porwal [29].

Again, if we put \( g = 0 \) in Theorems 2.1 and 2.2, then we obtain the corresponding results of Dixit and Porwal [21].

Lastly, if we put \( g \equiv 0, \varphi(z) = z/(1 - z) \), and \( \varphi(z) = z/(1 - z)^2 \) Theorems 2.1 and 2.2, then we obtain the result of Frasin [6].

We mention below some corollaries giving sharp bounds of the real parts on the ratio of univalent functions to its sequences of partial sums.

By putting \( \varphi(z) = z/(1 - z) \) in Theorem 2.1 for the function \( f \) of the form (1.2) with \( c_k = k - \alpha \) and \( \delta = 1 - \alpha \), then we obtain the following result of Silverman [19], Theorem 1.

**Corollary 3.1.** If \( f \) of the form (1.2) satisfies the condition (1.5) with \( c_k = k - \alpha \) and \( \delta = 1 - \alpha \), then

\[
\Re \left\{ \frac{f(z)}{f_m(z)} \right\} \geq \frac{m}{m + 1 - \alpha}, \quad z \in \mathbb{U}. \tag{3.1}
\]

The result is sharp for every \( m \), with the extremal function given by

\[
f(z) = z + \frac{1 - \alpha}{m + 1 - \alpha} z^{m+1}. \tag{3.2}
\]

On the other hand, if we put \( \varphi(z) = z/(1 - z)^2 \) in Theorem 2.1 for the function \( f \) of the form (1.2) with \( c_k = k - \alpha \) and \( \delta = 1 - \alpha \), then we obtain the following result of Silverman, Theorem 4(i) [19].

**Corollary 3.2.** If \( f \) of the form (1.2) satisfies the condition (1.5) with \( c_k = k - \alpha \), then for \( z \in \mathbb{U} \)

\[
\Re \left\{ \frac{f'(z)}{f'_m(z)} \right\} \geq \frac{am}{m + 1 - \alpha}. \tag{3.3}
\]

The result is sharp for every \( m \), with the extremal function given by (3.2).

Also, if we put \( \varphi(z) = z/(1 - z) \) in Theorem 2.1 for the function \( f \) of the form (1.2) belonging to the class \( S_{\phi}(c_k, \delta) \), then we obtain the following result of Frasin [6].
Corollary 3.3. If \( f \in S_\phi(c_k, \delta) \), then

\[
\text{Re} \left\{ \frac{f(z)}{f_m(z)} \right\} \geq \frac{c_{m+1} - \delta}{c_{m+1}}, \quad (z \in U),
\]

where

\[
c_k \geq \begin{cases} 
\delta & \text{if } k = 2, 3, \ldots, m, \\
0 & \text{if } k = m + 1, m + 2, \ldots.
\end{cases}
\]

The result is sharp for every \( m \), with the extremal function given by

\[
f(z) = z + \frac{\delta}{c_{m+1}} z^{m+1}.
\]

Next, if we put \( \psi(z) = z/(1-z) \) in Theorem 2.1 for the function \( f \) of the form (1.2) with \( c_k = \rho_k(\lambda, \gamma, \eta) \) and \( \delta = 1 - \gamma \), then we obtain the following result of Murugusundaramoorthy et al. ([23], Theorem 2.1).

Corollary 3.4. If \( f \) of the form (1.2) satisfies the condition (1.5) with \( c_k = \rho_k(\lambda, \gamma, \eta) \) and \( \delta = 1 - \gamma \), then for \( z \in U \) :

\[
\text{Re} \left\{ \frac{f(z)}{f_m(z)} \right\} \geq \frac{\rho_{m+1}(\lambda, \gamma, \eta) - 1 + \gamma}{\rho_{m+1}(\lambda, \gamma, \eta)},
\]

where

\[
\rho_k(\lambda, \gamma, \eta) \geq \begin{cases} 
1 - \gamma & \text{if } k = 2, 3, \ldots, m, \\
\rho_{m+1}(\lambda, \gamma, \eta) & \text{if } k = m + 1, m + 2, \ldots.
\end{cases}
\]

The result is sharp for every \( m \), with the extremal function given by

\[
f(z) = z + \frac{1 - \gamma}{\rho_{m+1}(\lambda, \gamma, \eta)} z^{m+1}.
\]

Again, if we set \( \psi(z) = (z/(1-z)) + ((z/(1-z)) - z) \) in Theorem 2.1, then we obtain the following result of Porwal [28].

Corollary 3.5. If \( f \) of the form (1.1) with \( b_1 = 0 \), satisfies the condition (1.4) with

\[
c_k \geq \begin{cases} 
\delta & \text{if } k = 2, 3, \ldots, m, \\
c_{m+1} & \text{if } k = m + 1, m + 2, \ldots.
\end{cases}
\]
then
\[
\Re \left\{ \frac{f(z)}{f_m(z)} \right\} \geq \frac{c_{m+1}-\delta}{c_{m+1}}, \quad \forall z \in U. \tag{3.11}
\]

The result (3.11) is sharp with the function given by (3.6).

Here we give some open problems for the readers.

In 2004, Owa et al. [24] studied the starlikeness and convexity properties on the partial sums \( f_n(z) \) and \( g_n(z) \) of the familiar Koebe function \( f(z) = z/(1 - z)^2 \) which is the extremal function for the class \( S^* \) of starlike functions in the open unit disk \( U \) and the function \( g(z) = z/(1 - z) \) which is the extremal function for the class \( K \) of convex functions in the open unit disk \( U \), respectively. They also presented some illustrative examples by using Mathematica (Version 4.0). It is interesting to obtain analogues results on harmonic starlikeness and convexity properties of the partial sums of the harmonic Koebe function.

In 2003, Jahangiri et al. [30] studied the construction of sense-preserving, univalent, and close-to-convex harmonic functions by using of the Alexander integral transforms of certain analytic functions (which are starlike or convex of positive order). They construct a function
\[
g(z) = z + \frac{1 - \alpha}{k - \alpha} z^k + \frac{\alpha}{2} \left( \frac{1 - \alpha}{k + 1} \right)(k - \alpha)(z)^{k+1}, \tag{3.12}
\]
which is sense-preserving, univalent, and close-to-convex harmonic in \( U \), by using the result of Theorem 2 [30] and taking the following function:
\[
f(z) = z + \frac{1 - \alpha}{k(k - \alpha)} z^k, \quad (k > 1; 0 \leq \alpha < 1). \tag{3.13}
\]

It is worthy to note that the function (3.13) is of the form (3.6) with \( c_k = k(k - \alpha) \) and \( \delta = 1 - \alpha \). Therefore, it is natural to ask that the results of [30] may be generalized for the function of the form (3.6).
