1. Introduction

Let $E$ be a real normed linear space, $E^*$ its dual space, and $J : E \to 2^{E^*}$ the normalized duality mapping defined by

$$J(x) = \left\{ f \in E^* : \langle x, f \rangle = \|x\| \cdot \|f\| = \|f\|^2 \right\},$$

(1.1)

where $\langle \cdot, \cdot \rangle$ denotes the generalized duality pairing. The single-valued normalized duality mapping is denoted by $j$. 
Definition 1.1. A mapping $T : E \rightarrow E$ is said to be

(1) strongly accretive if, for all $x, y \in E$, there exist a constant $k \in (0, 1)$ and $j(x - y) \in J(x - y)$ such that

$$\langle Tx - Ty, j(x - y) \rangle \geq k\|x - y\|^2,$$

(1.2)

(2) $\phi$-strongly accretive if there exist $j(x - y) \in J(x - y)$ and a strictly increasing function $\phi : [0, +\infty) \rightarrow [0, +\infty)$ with $\phi(0) = 0$ such that

$$\langle Tx - Ty, j(x - y) \rangle \geq \phi(\|x - y\|)\|x - y\|, \quad \forall x, y \in E,$$

(1.3)

(3) generalized $\Phi$-accretive if, for all $x, y \in E$, there exist $j(x - y) \in J(x - y)$ and a strictly increasing function $\Phi : [0, +\infty) \rightarrow [0, +\infty)$ with $\Phi(0) = 0$ such that

$$\langle Tx - Ty, j(x - y) \rangle \geq \Phi(\|x - y\|).$$

(1.4)

Definition 1.2. Let $N(T) = \{x \in E : Tx = 0\} \neq \emptyset$. The mapping $T$ is called strongly quasi-accretive if, for all $x \in E$, $q \in N(T)$, there exist a constant $k \in (0, 1)$ and $j(x - y) \in J(x - y)$ such that $\langle Tx - Tq, j(x - q) \rangle \geq k\|x - q\|^2$; $T$ is called $\phi$-strongly quasi-accretive if, for all $x \in E$, $q \in N(T)$, there exists a function $\phi$ such that $\langle Tx - Tq, j(x - q) \rangle \geq \phi(\|x - q\|)\|x - q\|$, where $\phi$ is as in Definition 1.1. Finally, $T$ is called generalized $\Phi$-quasi-accretive if, for each $x \in E$, $q \in N(T)$, there exist $j(x - q) \in J(x - q)$ and a strictly increasing function $\Phi : [0, +\infty) \rightarrow [0, +\infty)$ with $\Phi(0) = 0$ such that $\langle Tx - Tq, j(x - q) \rangle \geq \Phi(\|x - q\|).

Closely related to the class of accretive-type mappings are those of pseudocontractive types.

Definition 1.3. A mapping $T$ with domain $D(T)$ and range $R(T)$ is said to be

(1) strongly pseudocontractive if there exist a constant $k \in (0, 1)$ and $j(x - y) \in J(x - y)$ such that, for each $x, y \in D(T),

$$\langle Tx - Ty, j(x - y) \rangle \leq k\|x - y\|^2,$$

(1.5)

(2) $\phi$-strongly pseudocontractive if there exist $j(x - y) \in J(x - y)$ and a strictly increasing function $\phi : [0, +\infty) \rightarrow [0, +\infty)$ with $\phi(0) = 0$ such that

$$\langle Tx - Ty, j(x - y) \rangle \leq \|x - y\|^2 - \phi(\|x - y\|)\|x - y\|, \quad \forall x, y \in D(T),$$

(1.6)

(3) generalized $\Phi$-pseudocontractive if, for all $x, y \in D(T)$, there exist $j(x - y) \in J(x - y)$ and a strictly increasing function $\Phi : [0, +\infty) \rightarrow [0, +\infty)$ with $\Phi(0) = 0$ such that

$$\langle Tx - Ty, j(x - y) \rangle \leq \|x - y\|^2 - \Phi(\|x - y\|).$$

(1.7)
Definition 1.4. Let \( F(T) = \{ x \in E : Tx = x \} \neq \emptyset \). The mapping \( T \) is called generalized \( \Phi \)-hemi-pseudocontractive if, for all \( x \in D(T), q \in F(T) \), there exist \( j(x - q) \in J(x - q) \) and a strictly increasing function \( \Phi : [0, +\infty) \to [0, +\infty) \) with \( \Phi(0) = 0 \) such that
\[
\langle Tx - Tq, j(x - q) \rangle \leq \| x - q \|^2 - \Phi(\| x - q \|).
\] (1.8)

Obviously, a mapping \( T \) is strongly pseudocontractive, \( \phi \)-strongly pseudocontractive, generalized \( \Phi \)-pseudocontractive, and generalized \( \Phi \)-hemicontactive if and only if \((I - T)\) is strongly accretive, \( \phi \)-strongly accretive, generalized \( \Phi \)-accretive, and generalized \( \Phi \)-quasi-accretive, respectively.

It is shown in [1] that the class of strongly pseudocontractive mappings is a proper subclass of \( \phi \)-strongly pseudocontractive mappings. Furthermore, an example in [2] shows that the class of \( \phi \)-strongly pseudocontractive mappings with the nonempty fixed point set is a proper subclass of \( \Phi \)-hemicontactive mappings. Hence, the class of generalized \( \Phi \)-hemicontactive mappings is the most general among those defined above.

Definition 1.5. The mapping \( T : E \to E \) is called Lipschitz if exists a constant \( L > 0 \) such that
\[
\| Tx - Ty \| \leq L \| x - y \|, \quad \forall x, y \in E.
\] (1.9)

It is clear that if \( T \) is Lipschitz then it must be uniformly continuous. Otherwise, it is not true.

The following iteration schemes were introduced by Xu [3] in 1998. Let \( K \) be a nonempty convex subset of \( E \). For any given \( x_0 \in K \), the sequence \( \{ x_n \}_{n=0}^{\infty} \) is defined by
\[
x_{n+1} = \alpha_n x_n + \beta_n T y_n + \gamma_n \delta_n, \\
y_n = \alpha'_n x_n + \beta'_n T x_n + \gamma'_n \eta_n, \quad \forall n \geq 0,
\] (1.10)
is called the Ishikawa iteration sequence with errors, where \( \{ \delta_n \}_{n=0}^{\infty}, \{ \eta_n \}_{n=0}^{\infty} \) are arbitrary bounded sequences in \( K \) and \( \{ \alpha_n \}_{n=0}^{\infty}, \{ \beta_n \}_{n=0}^{\infty}, \{ \gamma_n \}_{n=0}^{\infty}, \{ \alpha'_n \}_{n=0}^{\infty}, \{ \beta'_n \}_{n=0}^{\infty}, \{ \gamma'_n \}_{n=0}^{\infty} \) are six real sequences in \([0, 1]\) such that \( \alpha_n + \beta_n + \gamma_n = \alpha'_n + \beta'_n + \gamma'_n = 1 \) for all \( n \geq 0 \) and satisfy certain conditions.

If \( \beta'_n = \gamma'_n = 0, \) for all \( n \geq 0, \) then, from (1.10), we get the Mann iteration sequence with errors \( \{ u_n \}_{n=0}^{\infty} \) defined by
\[
\forall u_0 \in K, \quad u_{n+1} = \alpha_n u_n + \beta_n T u_n + \gamma_n \epsilon_n, \quad \forall n \geq 0,
\] (1.11)
where \( \{ \epsilon_n \}_{n=0}^{\infty} \) is an arbitrary bounded sequence in \( K \).

Numerous convergence results have been proved through iterative methods of approximating fixed points of Lipschitz pseudocontractive- (accretive-) type nonlinear mappings [3–10]. Most of these results have been extended to uniformly continuous mappings by some authors. Recently, C. E. Chidume and C. O. Chidume in [11] gave the most general result for uniformly continuous generalized \( \Phi \)-hemicontactive mappings in normed linear. Their results are as follows.

Theorem 1.6 (see [11, Theorem 2.3]). Let \( E \) be a real normed linear space, \( K \) nonempty subset of \( E \), and \( T : E \to K \) a uniformly continuous generalized \( \Phi \)-hemicontactive mapping, that is, there
Lemma 1.7. Let $E$ be a real normed space. Then, for all $x, y \in E$, the following inequality holds:

$$
\|x + y\|^2 \leq \|x\|^2 + 2\langle y, j(x + y) \rangle, \quad \forall j(x + y) \in J(x + y). \tag{1.14}
$$

Lemma 1.8 (see [14]). Let $\Phi : [0, +\infty) \to [0, +\infty)$ be a strictly increasing continuous function with $\Phi(0) = 0$ and $\{\theta_n\}, \{\sigma_n\}$, and $\{\lambda_n\}$ nonnegative three sequences that satisfy the following inequality:

$$
\theta_{n+1}^2 \leq \theta_n^2 - 2\lambda_n\Phi(\theta_{n+1}) + \sigma_n, \quad n \geq N, \tag{1.15}
$$

where $\lambda_n \in (0, 1), \lim_{n \to \infty} \lambda_n = 0$, and $\sum_{n=0}^{\infty} \lambda_n = \infty$, $\sigma_n = o(\lambda_n)$. Then $\theta_n \to 0$ as $n \to \infty$. \hfill $\square$
2. Main Results

Theorem 2.1. Let $K$ be a nonempty closed convex subset of a real normed linear space $E$. Suppose that $T : K \rightarrow K$ is a uniformly continuous generalized $\Phi$-hemicontactive mapping with $F(T) \neq \emptyset$. Let $\{u_n\}$ be a sequence in $K$ defined iteratively from some $u_0 \in K$ by (1.11), where $\{\varepsilon_n\}$ is an arbitrary bounded sequence in $K$ and $\{\alpha_n\}, \{\beta_n\},$ and $\{\gamma_n\}$ are three sequences in $[0, 1]$ satisfying the following conditions:

(i) $\alpha_n + \beta_n + \gamma_n = 1$,

(ii) $\sum_{n=0}^{\infty} \beta_n = \infty$,

(iii) $\lim_{n \to \infty} \beta_n = 0$,

(iv) $\gamma_n = o(\beta_n)$.

Then, the iteration sequence $\{u_n\}$ converges strongly to the unique fixed point of $T$.

Proof. Let $q \in F(T)$. The uniqueness of the fixed point of $T$ comes from Definition 1.4.

First, we prove that there exists $u_0 \in K$ with $u_0 \neq T u_0$ such that $t_0 = \|u_0 - T u_0\| \cdot \|u_0 - q\| \in R(\Phi)$. In fact, if $u_0 = T u_0$, then we are done. Otherwise, there exists the smallest positive integer $n_0 \in N$ such that $u_{n_0} \neq T u_{n_0}$. We denote $u_{n_0} = u_0$, and then we obtain that $t_0 = \|u_0 - T u_0\| \cdot \|u_0 - q\| \in R(\Phi)$. Indeed, if $R(\Phi) = [0, +\infty)$, then $t_0 \in R(\Phi)$. If $R(\Phi) = [0, A]$ with $0 < A < +\infty$, then, for $q \in K$, there exists a sequence $\{w_n\} \subset K$ such that $w_n \rightarrow q$ as $n \rightarrow \infty$ with $w_n \neq q$, and we also obtain that the sequence $\{w_n - T w_n\}$ is bounded. So there exists $n_0 \in N$ such that $\|w_n - T w_n\| \cdot \|w_n - q\| \in R(\Phi)$ for $n \geq n_0$, and then we redefine $u_0 = w_{n_0}$. Let $\omega_0 = \Phi^{-1}(\|(u_0 - q) - (T u_0 - q)\| \cdot \|u_0 - q\|) > 0.$

Next for $n \geq 0$ we will prove $\|u_n - q\| \leq \omega_0$ by induction. Clearly, $\|u_0 - q\| \leq \omega_0$ holds. Suppose that $\|u_n - q\| \leq \omega_0$, for some $n$; then we want to prove $\|u_{n+1} - q\| \leq \omega_0$. If it is not the case, then $\|u_{n+1} - q\| > \omega_0$. Since $T$ is a uniformly continuous mapping, setting $\varepsilon_0 = \Phi(\omega_0)/12\omega_0$, there exists $\delta > 0$ such that $\|Tx - Ty\| < \Phi(\omega_0)/12\omega_0$ whenever $\|x - y\| < \delta$ and $T$ is a bounded operator. Set $M = \sup \{\|Tx\| : \|x - q\| \leq \omega_0\} + \sup_{n} \|\varepsilon_n\|$. Since $\lim_{n \to \infty} \beta_n = 0$, $\gamma_n = o(\beta_n)$, without loss of generality, let

$$\frac{\beta_n \gamma_n}{\beta_n} < \min \left\{ \frac{\omega_0}{4(M + \|q\|)}, \frac{\delta}{2M + 2\omega_0 + 2\|q\|}, \frac{\Phi(\omega_0)}{6\omega_0}, \frac{\Phi(\omega_0)}{6(\omega_0 + M + \|q\|^2)} \right\}, \quad n \geq 0. \quad (2.1)$$

From (1.10), we have

$$\|u_{n+1} - q\| = \|\alpha_n(u_n - q) + \beta_nTu_n + \gamma_n\varepsilon_n - (\beta_n + \gamma_n)q\|$$

$$\leq \|u_n - q\| + (\beta_n\|Tu_n\| + \gamma_n\|\varepsilon_n\| + (\beta_n + \gamma_n)\|q\|)$$

$$\leq \omega_0 + \beta_n(\|Tu_n\| + \|\varepsilon_n\| + 2\|q\|)$$

$$\leq \omega_0 + \beta_n(2M + 2\|q\|) \leq \frac{3}{2} \omega_0.$$

(2.2)

$$\|u_{n+1} - u_n\| = \|\beta_nTu_n + \gamma_n\varepsilon_n - (\beta_n + \gamma_n)u_n\|$$

$$\leq \beta_n\|Tu_n\| + \gamma_n\|\varepsilon_n\| + (\beta_n + \gamma_n)\|u_n - q\| + (\beta_n + \gamma_n)\|q\|$$

$$\leq \beta_n(\|Tu_n\| + \|\varepsilon_n\| + 2\|u_n - q\| + 2\|q\|)$$

$$\leq \beta_n(2M + 2\omega_0 + 2\|q\|).$$
Applying Lemma 1.7, the recursion (1.11), and the inequalities above, we obtain

\[ \| u_{n+1} - q \|^2 = \| (u_n - q) + \beta_n T u_n + \gamma_n \epsilon_n - (\beta_n + \gamma_n) u_n \|^2 \]
\[ \leq \| u_n - q \|^2 + 2 \beta_n T u_n + \gamma_n \epsilon_n - (\beta_n + \gamma_n) u_n, j (u_{n+1} - q) \]
\[ \leq \| u_n - q \|^2 + 2 \beta_n \langle T u_{n+1} - T q, j (u_{n+1} - q) \rangle \]
\[ + 2 \beta_n \langle (T u_n - T u_{n+1}) + (u_{n+1} - u_n) - (u_{n+1} - q), j (u_{n+1} - q) \rangle \]
\[ + 2 \gamma_n (\| u_n - q \| + \| q \| + \| \epsilon_n \|) \| u_{n+1} - q \| \]
\[ \leq \| u_n - q \|^2 + 2 \beta_n \| T u_n - T u_{n+1} \| \cdot \| u_{n+1} - q \| \]
\[ + 2 \beta_n \| u_n - u_{n+1} \| \cdot \| u_{n+1} - q \| + 2 \gamma_n (\| q \| + M) \| u_{n+1} - q \| \]
\[ \leq \omega_0^2 - 2 \beta_n \Phi (\| u_{n+1} - q \|) + 2 \beta_n \Phi (\| u_n \|) \frac{3 \omega_0}{2} + 2 \beta_n \Phi (\| u_n \|) \frac{3 \omega_0}{2} + 2 \beta_n \Phi (\| u_n \|) \frac{3 \omega_0}{2} \]
\[ < \omega_0^2, \]

which is a contraction with the assumption \( \| u_{n+1} - q \| > \omega_0 \). Then, \( \| u_{n+1} - q \| \leq \omega_0 \), that is, the sequence \( \{ u_n \} \) is bounded. It leads to

\[ \lim_{n \to \infty} \| u_{n+1} - u_n \| = 0, \quad \lim_{n \to \infty} \| T u_{n+1} - T u_n \| = 0. \] (2.4)

Again using Lemma 1.7, we have

\[ \| u_{n+1} - q \|^2 = \| (u_n - q) + \beta_n T u_n + \gamma_n \epsilon_n - (\beta_n + \gamma_n) u_n \|^2 \]
\[ \leq \| u_n - q \|^2 + 2 \beta_n T u_n + \gamma_n \epsilon_n - (\beta_n + \gamma_n) u_n, j (u_{n+1} - q) \]
\[ \leq \| u_n - q \|^2 + 2 \beta_n \langle T u_{n+1} - T q, j (u_{n+1} - q) \rangle \]
\[ + 2 \beta_n \langle (T u_n - T u_{n+1}) + (u_{n+1} - u_n) - (u_{n+1} - q), j (u_{n+1} - q) \rangle \]
\[ + 2 \gamma_n (\| u_n - q \| + \| q \| + \| \epsilon_n \|) \| u_{n+1} - q \| \]
\[ \leq \| u_n - q \|^2 + 2 \beta_n \Phi (\| u_{n+1} - q \|) + 2 \beta_n \| T u_n - T u_{n+1} \| \cdot \| u_{n+1} - q \| \]
\[ + 2 \beta_n \| u_n - u_{n+1} \| \cdot \| u_{n+1} - q \| + 2 \gamma_n (\| q \| + M) \| u_{n+1} - q \| \]
\[ \leq \| u_n - q \|^2 + 2 \beta_n \Phi (\| u_{n+1} - q \|) + A_n, \]

where

\[ A_n = 2 \beta_n \| T u_n - T u_{n+1} \| \cdot \| u_{n+1} - q \| + 2 \beta_n \| u_n - u_{n+1} \| \cdot \| u_{n+1} - q \| \]
\[ + 2 \gamma_n (\| q \| + M) \| u_{n+1} - q \| \]
\[ = o(\beta_n). \] (2.6)

Therefore, (2.5) becomes

\[ \| u_{n+1} - q \|^2 \leq \| u_n - q \|^2 - 2 \beta_n \Phi (\| u_{n+1} - q \|) + o(\beta_n). \] (2.7)

From Lemma 1.8, we obtain \( \lim_{n \to \infty} \| u_n - q \| = 0. \)
Theorem 2.2. Let $K$ be a nonempty closed convex subset of a real normed linear space $E$ and $T : K \to K$ a uniformly continuous generalized $\Phi$-pseudocontractive mapping with $F(T) \neq \emptyset$. Let \{u_n\}, \{x_n\} be two sequences in $K$ defined iteratively from some $u_0 \neq x_0 \in K$ by (1.11) and (1.10), where \{\delta_n\}, \{\eta_n\}, \{\epsilon_n\} are three arbitrary bounded sequences in $K$ and \{\alpha_n\}, \{\beta_n\}, \{\gamma_n\}, \{\alpha'_n\}, \{\beta'_n\}, \{\gamma'_n\}$, and \{\gamma''_n\} are six sequences in $[0, 1]$ satisfying the following conditions:

(i) $\alpha_n + \beta_n + \gamma_n = \alpha'_n + \beta'_n + \gamma'_n = 1$,
(ii) $\sum_{n=0}^{\infty} \beta_n = \infty$,
(iii) $\lim_{n \to \infty} \beta_n = \lim_{n \to \infty} \beta'_n = \lim_{n \to \infty} \gamma'_n = 0$,
(iv) $\gamma_n = o(\beta_n)$.

Then, the following two assertions are equivalent:

(1) Iteration (1.11) converges strongly to the unique fixed point of $T$,
(2) Iteration (1.10) converges strongly to the unique fixed point of $T$.

Proof. Let $q \in F(T)$. The uniqueness of $q$ comes from Definition 1.4. If the Ishikawa iteration with errors converges to $q$, then setting $\beta'_n = \gamma'_n = 0$, for all $n \geq 0$ in (1.10), we can get the convergence of the Mann iteration with errors. Conversely, we only prove that (1)$\implies$(2), that is, if the Mann iteration with errors converges to $q$, we want to prove the convergence of the Ishikawa iteration with errors.

First, we will prove that there exists $x_0 \in K$ with $x_0 \neq Tx_0$ such that $t_0 = \|x_0 - Tx_0\| : \|x_0 - q\| \in R(\Phi)$.

In fact, if $x_0 = Tx_0$, then we are done. Otherwise, there exists the smallest positive integer $N_0 \in N$ such that $x_N \neq x_{N_0}$. We denote $x_{N_0} = x_0$, and then we obtain that $t_0 = \|x_0 - Tx_0\| : \|x_0 - q\| \in R(\Phi)$. Indeed if $R(\Phi) = [0, +\infty)$, then $t_0 \in R(\Phi)$. If $R(\Phi) = [0, A)$ with $0 < A < +\infty$, then for $q \in K$ there exists a sequence \{w_n\} $\subset K$ such that $w_n \to q$ as $n \to \infty$ with $w_n \neq q$, and we also obtain that the sequence \{w_n - Tw_n\} is bounded. So there exists $n_0 \in N$ such that $\|w_n - Tw_n\| : \|w_n - q\| \in R(\Phi)$, $n \geq n_0$, and then we redefine $x_0 = w_n$. Let $\mu_0 = \Phi^{-1}(\|x_0 - q\| - (Tx_0 - q)) : \|x_0 - q\| > 0$.

Second, we will prove that the sequence \{x_n - q\} is a bounded sequence.

Set

$$
B_1 = \{\|x - q\| \leq \mu_0 : x \in K\}, \quad B_2 = \{\|x - q\| \leq 2\mu_0 : x \in K\},
M_1 = \max_{x \in B_2, n \in N} \left\{\sup_{\|\|Tx\|\|} \sup_{\|\|\|\eta_n\|\|} \sup_{\|\|\|\delta_n\|\|} : \sup_{\|\|\|\eta_n\|\|} \sup_{\|\|\|\delta_n\|\|} : \sup_{\|\|\|\eta_n\|\|} \sup_{\|\|\|\delta_n\|\|} \right\}.
$$

Since $T$ is uniformly continuous, for $\epsilon = \Phi(\mu_0) / 5\mu_0$, there exists $\delta > 0$ such that $\|Tx - Ty\| < \epsilon$ whenever $\|x - y\| < \delta$. Now let $k = \min\{1, \mu_0 / 4(M_1 + \mu_0 + \|q\|), \delta / 2(4M_1 + \mu_0 + \|q\|), \Phi(\mu_0) / 20\mu_0(M_1 + \mu_0 + \|q\|)\}$. By the control conditions (iii) and (iv), without loss of generality, set $\alpha_n = \alpha'_n, \beta_n = \beta'_n, \gamma_n = \gamma'_n, \delta_n = \gamma''_n, \mu_0 < k$, for all $n \geq 0$.

Observe that if $x_n \in B_1$, we obtain $y_n \in B_2$. Indeed

$$
\|y_n - q\| = \|(1 - \beta'_n - \gamma'_n)x_n + \beta'_n Tx_n + \gamma'_n \eta_n - q\|
\leq \|x_n - q\| + \beta'_n \|Tx_n\| + \gamma'_n \|\eta_n\| + (\beta'_n + \gamma'_n) \|q\|
\leq \mu_0 + k(2M_1 + 2\mu_0 + 2\|q\|)
\leq 2\mu_0.
$$
Next, by induction, we prove \( x_n \in B_1 \). Clearly, from (2.1), we obtain \( \|x_0 - q\| \leq \mu_0 \), that is, \( x_0 \in B_1 \). Set \( \|x_n - q\| \leq \mu_0 \), for some \( n \); then we will prove that \( \|x_{n+1} - q\| \leq \mu_0 \). If it is not the case, we assume that \( \|x_{n+1} - q\| > \mu_0 \). From (1.10), we obtain the following inequalities:

\[
\|x_{n+1} - q\| = \|x_n + \beta_n T y_n + \gamma_n \delta_n - q\| \\
\leq \|(1 - \beta_n - \gamma_n) (x_n - q) + \beta_n T y_n + \gamma_n \delta_n + (\beta_n + \gamma_n) q\| \\
\leq \|x_n - q\| + (\beta_n + \gamma_n) \|x_n - q\| + \beta_n \|T y_n\| + \gamma_n \|\delta_n\| + (\beta_n + \gamma_n) \|q\| \\
\leq \mu_0 + k (2\mu_0 + 2M_1 + 2\|q\|) \leq \frac{5}{4}\mu_0,
\]

\[
\|x_{n+1} - x_n\| = \|\beta_n T y_n + \gamma_n \delta_n - (\beta_n + \gamma_n) x_n\| \\
\leq (\beta_n + \gamma_n) \|x_n - q\| + \beta_n \|T y_n\| + \gamma_n \|\delta_n\| + (\beta_n + \gamma_n) \|q\| \\
\leq k (2\mu_0 + 2M_1 + 2\|q\|) \leq \frac{\Phi(\mu_0)}{10\mu_0}.
\]

\[
\|x_{n+1} - y_n\| = \|(\alpha_n - \alpha_n') x_n + \beta_n T y_n - \beta_n' T x_n + \gamma_n \delta_n - \gamma_n' \eta_n\| \\
\leq |\alpha_n - \alpha_n'| \cdot \|x_n - q\| + \beta_n \|T y_n\| + \beta_n' \|T x_n\| + \gamma_n \|\delta_n\| + \gamma_n' \|\eta_n\| + |\alpha_n - \alpha_n'| \cdot \|q\| \\
\leq k (\mu_0 + 4M_1 + \|q\|) \leq \delta.
\]

(2.10)

Since \( T \) is a uniformly continuous mapping, then

\[
\|T x_{n+1} - T y_n\| \leq \epsilon = \frac{\Phi(\mu_0)}{5\mu_0}.
\]

(2.11)

Since \( \gamma_n = o(\beta_n) \), we let

\[
\gamma_n < \beta_n \cdot \frac{1}{8} \cdot \Phi(\mu_0) \cdot \left(\frac{4}{5\mu_0}\right)^2.
\]

(2.12)

From (2.9)–(2.12), we have

\[
\|x_{n+1} - q\|^2 = \|(1 - \beta_n - \gamma_n) x_n + \beta_n T y_n + \gamma_n \delta_n - q\|^2 \\
= \|(x_n - q) + \beta_n T y_n + \gamma_n \delta_n - (\beta_n + \gamma_n) x_n\|^2 \\
\leq \|x_n - q\|^2 + 2\beta_n T y_n + \gamma_n \delta_n - (\beta_n + \gamma_n) x_n, j(x_{n+1} - q) \\
\leq \|x_n - q\|^2 + 2\beta_n \langle T x_{n+1} - T q, j(x_{n+1} - q) \rangle + 2\beta_n \langle (T y_n - T x_{n+1}), j(x_{n+1} - q) \rangle \\
+ 2(\beta_n + \gamma_n) \langle (x_{n+1} - x_n), j(x_{n+1} - q) \rangle + 2\gamma_n \|\delta_n\| \cdot \|x_{n+1} - q\| \\
- 2(\beta_n + \gamma_n) \langle (x_{n+1} - q), j(x_{n+1} - q) \rangle \\
\leq \|x_n - q\|^2 - 2\beta_n \Phi(\|x_{n+1} - q\|) + 2\beta_n \|T x_{n+1} - T y_n\| \cdot \|x_{n+1} - q\| \\
+ 2(\beta_n + \gamma_n) \|x_{n+1} - x_n\| \cdot \|x_{n+1} - q\| + 2\gamma_n \|\delta_n\| \|x_{n+1} - q\| + 2\gamma_n \|x_{n+1} - q\|^2
\]
\[ < \mu_0^2 - 2\beta_n \Phi(\mu_0) + 2 \beta_n \frac{\Phi(\mu_0)}{5\mu_0} \cdot \frac{5\mu_0}{4} + 4 \beta_n \frac{\Phi(\mu_0)}{10\mu_0} \cdot \frac{5\mu_0}{4} + 2 \beta_n \frac{\Phi(\mu_0)}{5\mu_0} \cdot \frac{5\mu_0}{4} \\
\quad + 2 \beta_n \cdot \frac{1}{8} \cdot \Phi(\mu_0) \cdot \left( \frac{4}{5\mu_0} \right)^2 \cdot \left( \frac{5\mu_0}{4} \right)^2 \\
= \mu_0^2, \]

(2.13)

which is a contradiction with the assumption \( \|x_{n+1} - q\| > \mu_0 \). Hence, \( x_n \in B_1 \), that is, the sequence \( \{x_n\} \) is bounded. From (2.9), the sequence \( \{y_n\} \) is also bounded. So we obtain

\[ \lim_{n \to \infty} \|x_{n+1} - x_n\| = \lim_{n \to \infty} \|u_{n+1} - u_n\| = \lim_{n \to \infty} \|x_{n+1} - y_n\| = 0. \quad (2.14) \]

Since \( T \) is a uniformly continuous mapping, then

\[ \lim_{n \to \infty} \|Tu_{n+1} - Tu_n\| = \lim_{n \to \infty} \|Tx_{n+1} - Ty_n\| = 0. \quad (2.15) \]

Using the recursion formula (1.10), we compute as follows:

\[ \|x_{n+1} - u_{n+1}\|^2 \leq \|x_n - u_n\|^2 - 2\beta_n \Phi(\|x_{n+1} - u_{n+1}\|) + 2 \beta_n \|Tx_{n+1} - Ty_n\| \cdot \|x_{n+1} - u_{n+1}\| \\
\quad + 2 \beta_n \|Tu_n - Tu_{n+1}\| \cdot \|x_{n+1} - u_{n+1}\| + 2(\beta_n + \gamma_n) \|u_n - u_{n+1}\| \cdot \|x_{n+1} - u_{n+1}\| \\
\quad + 2(\beta_n + \gamma_n) \|x_{n+1} - x_n\| \cdot \|x_{n+1} - u_{n+1}\| + 2\gamma_n(\|\delta_n\| + \|\varepsilon_n\|) \|x_{n+1} - u_{n+1}\| \\
= \|x_n - u_n\|^2 - 2\beta_n \Phi(\|x_{n+1} - u_{n+1}\|) + A_n, \quad (2.16) \]

where

\[ A_n = 2 \beta_n \|Tx_{n+1} - Ty_n\| \cdot \|x_{n+1} - u_{n+1}\| \\
\quad + 2 \beta_n \|Tu_n - Tu_{n+1}\| \cdot \|x_{n+1} - u_{n+1}\| + 2(\beta_n + \gamma_n) \|x_{n+1} - x_n\| \cdot \|x_{n+1} - u_{n+1}\| \\
\quad + 2\gamma_n(\|\delta_n\| + \|\varepsilon_n\|) \|x_{n+1} - u_{n+1}\|. \quad (2.17) \]

Since the sequence \( \{x_n - u_n\} \) is bounded, from (2.15), (2.16), and the control condition (iv), we get \( A_n = o(\beta_n) \). Then, in (2.18), set \( \theta_n = \|x_n - u_n\|, \lambda_n = \beta_n, \) and \( \sigma_n = A_n \). From Lemma 1.8, we obtain \( \lim_{n \to \infty} \|x_{n+1} - u_{n+1}\| = 0 \). Since \( \lim_{n \to \infty} \|u_n - q\| = 0 \), using inequality \( 0 \leq \|x_n - q\| \leq \|x_n - u_n\| + \|u_n - q\| \), then \( \lim_{n \to \infty} \|x_n - q\| = 0 \), and we complete the proof of Theorem 2.1. \( \square \)

From Theorems 2.1 and 2.2, we obtain the following corollary.

**Corollary 2.3.** Let \( K \) be a nonempty convex subset of a real normed linear space \( E \). \( T : K \to K \) is a uniformly continuous generalized \( \Phi \)-hemicontractive mapping with \( F(T) \neq \emptyset \). Let \( \{x_n\} \) be a sequence in \( K \) defined iteratively from some \( x_0 \in K \) by (1.10), where \( \{\delta_n\}, \{\eta_n\} \) are arbitrary
bounded sequences in \( K \) and \( \{ \alpha_n \}, \{ \beta_n \}, \{ \gamma_n \}, \{ \alpha'_n \}, \{ \beta'_n \}, \) and \( \{ \gamma'_n \} \) are sequences in \([0,1]\) satisfying the following conditions:

(i) \( \alpha_n + \beta_n + \gamma_n = \alpha'_n + \beta'_n + \gamma'_n = 1 \),
(ii) \( \sum_{n=0}^{\infty} \beta_n = \infty \),
(iii) \( \lim_{n \to \infty} \beta_n = \lim_{n \to \infty} \beta'_n = \lim_{n \to \infty} \gamma'_n = 0 \),
(iv) \( \gamma_n = o(\beta_n) \).

Then, the iteration sequence \( \{ x_n \} \) defined by (1.10) converges strongly to the unique fixed point of \( T \).

**Corollary 2.4.** Let \( T : E \to E \) be a uniformly continuous generalized \( \Phi \)-accretive mapping with \( N(T) \neq \emptyset \). For some \( u_0, x_0 \in E \), the iteration sequences \( \{ u_n \}, \{ x_n \} \) in \( E \) are defined as follows:

\[
\begin{align*}
  u_{n+1} &= \alpha_n u_n + \beta_n Su_n + \gamma_n \varepsilon_n, \quad \forall n \geq 0, \\
  x_{n+1} &= \alpha_n x_n + \beta_n S y_n + \gamma_n \delta_n, \\
  y_n &= \alpha'_n x_n + \beta'_n S x_n + \gamma'_n \eta_n, \quad \forall n \geq 0,
\end{align*}
\]

where \( Sx := x - Tx \) for all \( x \in E \). \( \{ \varepsilon_n \}, \{ \eta_n \}, \) and \( \{ \varepsilon_n \} \) are arbitrary bounded sequences in \( K \) and \( \{ \alpha_n \}, \{ \beta_n \}, \{ \gamma_n \}, \{ \alpha'_n \}, \{ \beta'_n \}, \) and \( \{ \gamma'_n \} \) are sequences in \([0,1]\) satisfying the following conditions:

(i) \( \alpha_n + \beta_n + \gamma_n = \alpha'_n + \beta'_n + \gamma'_n = 1 \),
(ii) \( \sum_{n=0}^{\infty} \beta_n = \infty \),
(iii) \( \lim_{n \to \infty} \beta_n = \lim_{n \to \infty} \beta'_n = \lim_{n \to \infty} \gamma'_n = 0 \),
(iv) \( \gamma_n = o(\beta_n) \).

Then, the following two assertions are equivalent:

1. \( \{ x_n \} \) converges strongly to the unique fixed point of \( S \).
2. \( \{ u_n \} \) converges strongly to the unique fixed point of \( S \).

**Proof.** Let \( S = I - T \), and observe that \( T \) is a uniformly continuous generalized \( \Phi \)-accretive mapping if and only if \( S \) is a uniformly continuous generalized \( \Phi \)-pseudocontractive mapping. The result follows from Theorem 2.2. \( \square \)

**Remark 2.5.** Our results improve and extend the corresponding results of [11] in the following sense.

(i) We point out the gaps of C. E. Chidume and C. O. Chidume [11] in their proof and provide a counterexample.

(ii) In the proof method, Theorem 2.1 differs from Theorem 2.3 in [11].

(iii) The control conditions \( \sum_{n=0}^{\infty} (b_n + c_n)^2 < \infty \) and \( \sum_{n=0}^{\infty} c_n < \infty \) in Theorem 2.3 in [11] are replaced by the condition \( b_n = o(c_n) \). Under the new condition, we obtain the convergence theorem of the Mann iteration sequence with errors.

(iv) We also obtain the equivalence of convergence results between the Ishikawa and Mann iterations with errors.

(v) The Mann iteration sequence with errors is extended to the Ishikawa iteration sequence with errors.
