We establish the Calderón reproducing formula for functions in $L^2$ on the Heisenberg group $H^d$. Also, we develop this formula in $L^p(H^d)$ with $1 < p < \infty$.

1. Introduction

The classical Calderón reproducing formula reads

$$ f = \int_0^{+\infty} f * \phi_t * \psi_t \frac{dt}{t}, \quad (1.1) $$

where $\phi_t(x) = t^{-1} \phi(x/t)$, $\psi_t(x) = t^{-1} \psi(x/t)$, and $*$ denotes the convolution on $\mathbb{R}$. The Calderón reproducing formula is a useful tool in pure and applied mathematics (see [1-4]), particularly in wavelet theory (see [5, 6]). We always call (1.1) an inverse formula of wavelet transform. In [7], the authors generalized (1.1) to $\mathbb{R}^n$ when $\phi$ and $\psi$ are sufficiently nice normalized radial wavelet functions. The generalization of (1.1) involving nonradial wavelets $\phi$ and $\psi$ can be written in the following form:

$$ f = \int_{SO(n)} d\gamma \int_0^{+\infty} f * \phi_{\gamma,t} * \psi_{\gamma,t} \frac{dt}{t}, \quad (1.2) $$

where $\phi_{\gamma,t}$ and $\psi_{\gamma,t}$ are rotated versions of $\phi$ and $\psi$ on $\mathbb{R}^n$. The authors in [8, 9] established (1.1) for $f \in L^p(\mathbb{R})$. Holschneider [10] studied the formula (1.2) in case $f \in L^p(\mathbb{R}^2)$ and gave an inversion formula of the Radon transform in $L^p$-space by using wavelets. Furthermore,
Rubin [4] developed the Calderón reproducing formula, windowed X-ray transforms, the Radon transforms, and k-plane transforms in $L^p$-spaces on $\mathbb{R}^n$.

It is a remarkable fact that the Heisenberg group, denoted by $H^d$, arises in two fundamental but different setting in analysis. On the one hand, it can be realized as the boundary of the unit ball in several complex variables. On the other hand, an important aspect of the study of the Heisenberg group is the background of physics, namely, the mathematical ideas connected with the fundamental nations of quantum mechanics. In other words, there is its genesis in the context of quantum mechanics which emphasizes its symplectic role in connection with the Fourier transform, pseudodifferential operators, and related matters (see [11]). Due to this reason, many interesting works were devoted to the theory of harmonic analysis on $H^d$ in [11–13] and the references therein. Also, the researches of wavelet analysis on $H^d$ are concerned increasingly; for this we refer readers to [14–16]. And the inversion formula of the Radon transform by using inverse wavelet transform on $H^d$ was established in [17]. Our goal of the present article is to study the Calderón reproducing formula on the Heisenberg group in $L^p$-space with $1 < p < \infty$. In the sequel we will develop the theory of inverse Radon transform on $H^d$.

The Heisenberg group $H^d$ is a Lie group with the underlying manifold $C^d \times \mathbb{R}$, and the multiplication law is given by

$$(z,t)(z',t') = \left( z + z', t + t' + 2 \text{Im} z \overline{z}' \right),$$

(1.3)

where $z \overline{z}' = \sum_{j=1}^d z_j \overline{z}'_j$. The dilation of $H^d$ is defined by $\rho(z,t) = (\rho z, \rho^2 t)$ with $\rho > 0$. For $(z,t) \in H^d$, the homogeneous norm of $(z,t)$ is given by (see [11])

$$|(z,t)| = \left| (z,t)^{-1} \right| = \max \left\{ |z|, |t|^{1/2} \right\}.$$ (1.4)

Notice that $|\rho(z,t)| = \max \{|\rho z|, |\rho^2 t|^{1/2}\} = \rho |(z,t)|$. In addition, $| \cdot |$ satisfies the quasitriangle inequality:

$$|(z,t)(z',t')| \leq |(z,t)| + |(z',t')|.$$ (1.5)

The homogeneous dimension of $H^d$ is $2d + 2$, and the volume of a ball $B((z,t), r) = \{(z',t') \in H^d : |(z,t)^{-1}(z',t')| \leq r\}$ is $c' r^{2d+2}$, where $c'$ is a constant.

Let $P = \{(z,t,\rho) : (z,t) \in H^d, \rho > 0\}$; then $P$ is a locally compact nonunimodular group with the group law

$$(z,t,\rho)(z',t',\rho') = \left( z + \rho z', t + \rho^2 t' + 2 \text{Im} z \overline{z}', \rho \rho' \right).$$ (1.6)

The left and right Haar measures on $P$ are given by

$$d\mu(z,t,\rho) = \frac{dz \, dt \, d\rho}{\rho^{2d+3}}, \quad d\mu_r(z,t,\rho) = \frac{dz \, dt \, d\rho}{\rho},$$ (1.7)

where $dz$ denotes the Lebesgue measure on $C^d$. 
Let $L^p(H^d)$ be the space of measurable functions $f$ on $H^d$, such that

$$
\|f\|_{L^p(H^d)} = \left( \int_{H^d} |f(z,t)|^p \, dz \, dt \right)^{1/p} < +\infty, \quad \text{if } p \in [1, +\infty),
$$

$$
\|f\|_{L^p(H^d)} = \text{ess sup}_{(z,t) \in H^d} |f(z,t)| < +\infty, \quad \text{if } p = +\infty.
$$

From [18] we know that $\{E_\alpha(\xi) = (\sqrt{2}\xi)^\alpha / \sqrt{\alpha!} : \alpha \in (Z^+)^d\}$ is an orthonormal basis of the Hilbert space $\mathcal{E}$. For $\lambda \in R \setminus \{0\}$, let $\pi_\lambda$ be the Bargmann-Fock representation of $H^d$, which acts on $\mathcal{E}$ by

$$
\pi_\lambda(z,t)F(\xi) = \left\{ \begin{array}{ll}
    e^{-i\lambda z} |\xi|^2 e^{i\lambda|\xi|^2} F(\xi - \sqrt{\lambda} z), & \text{if } \lambda > 0, \\
    e^{-i\lambda z} |\xi|^2 e^{i\lambda|\xi|^2} F(\xi + \sqrt{\lambda} z), & \text{if } \lambda < 0.
\end{array} \right.
$$

The group Fourier transform of a function $f \in L^1(H^d)$ is defined by

$$
\hat{f}(\lambda) = \int_{H^d} f(z,t) \pi_\lambda(z,t) \, dz \, dt.
$$

Let $S_p(\mathcal{E}) (1 \leq p < +\infty)$ be the classes of Schatten-von Neumann operators on Hilbert space $\mathcal{E}$, and let $S_\infty(\mathcal{E})$ denote the algebra of all bounded operators, that is, $S_\infty(\mathcal{E}) = B(\mathcal{E})$. For $T \in S_p(\mathcal{E})$, let $\|T\|_p = (\text{tr}(T^* T)^{1/p})^{p/2}$ denote the $S_p$-norm of $T$. If $p = 2$, $\|T\|_2$ is just the Hilbert-Schmidt norm of $T$, that denotes $\|T\|_{HS}$. Let $\|T\|_\infty$ denote the usual operator norm of $T$ in $S_\infty(\mathcal{E})$. For $1 \leq p \leq +\infty$, let $L^p$ be the Banach space consisting of all weak measurable operator value functions $F$, which also satisfy $F(\lambda) \in S_p(\mathcal{E}|\lambda|)$, a.e. $\lambda \in R \setminus \{0\}$, and

$$
\|F\|_{L^p} = \left( \frac{\pi^{d+1}}{\pi d+1} \int_{R \setminus \{0\}} \|F(\lambda)\|_p^p |\lambda|^d d\lambda \right)^{1/p} < +\infty, \quad \text{if } 1 \leq p < +\infty,
$$

$$
\|F\|_{L^p} = \text{ess sup}_{\lambda \in R \setminus \{0\}} \|F(\lambda)\|_\infty < +\infty, \quad \text{if } p = \infty.
$$

For $f, g \in L^2(H^d)$, the Parseval formula is

$$
\langle f, g \rangle_{L^2(H^d)} = \frac{2^{d-1}}{\pi d+1} \int_{-\infty}^{+\infty} \text{tr}\left( \hat{g}(\lambda)^\dagger \hat{f}(\lambda) \right) |\lambda|^d d\lambda.
$$
where $\tilde{g}(\lambda)^*$ denotes the adjoint of $\tilde{g}(\lambda)$. The Plancherel formula is

$$\|f\|_{L^2(H^d)}^2 = \frac{2^{d-1}}{\pi^{d+1}} \int_{-\infty}^{+\infty} \|\tilde{f}(\lambda)\|_{HS}^2 |\lambda|^d d\lambda. \quad (1.14)$$

As a consequence of (1.13), one has the inversion of the Fourier transform:

$$f(z,t) = \frac{2^{d-1}}{\pi^{d+1}} \int_{-\infty}^{+\infty} \text{tr}\left( \pi_1(z,t)^* \tilde{f}(\lambda) \right) |\lambda|^d d\lambda. \quad (1.15)$$

Suppose $\rho > 0$, and let

$$f_{\rho}(z,t) = \rho^{-(2d+2)} f\left( \rho^{-1}(z,t) \right) = \rho^{-(2d+2)} f\left( \frac{z}{\rho}, \frac{t}{\rho^2} \right). \quad (1.16)$$

By a direct computation, we have

$$\tilde{f}_{\rho}(\lambda) = \tilde{f}(\rho \lambda). \quad (1.17)$$

Let $f * g$ be the convolution of $f$ and $g$, that is,

$$f * g(z,t) = \int_{H^d} f(z',t') g(\left( (z',t')^{-1}(z,t) \right) dz'dt'. \quad (1.18)$$

Then

$$\tilde{f} * \tilde{g}(\lambda) = \tilde{f}(\lambda)\tilde{g}(\lambda). \quad (1.19)$$

We should notice the following facts: if $\tilde{f}(z,t) = \overline{f((z,t)^{-1})} = \overline{f(-z,-t)}$, then

$$\tilde{f}(\lambda) = \tilde{f}(\lambda)^*. \quad (1.20)$$

And if $g(z,t) = f(-z,-t)$, then

$$\tilde{g}(\lambda) = \tilde{f}(-\lambda). \quad (1.21)$$

The further detail of harmonic analysis on $H^d$ can be found in [11, 12].
2. Calderón Reproducing Formula

The authors in [14, 15, 18] studied the theory of continuous wavelet associated with the concept of square integrable group representations. The unitary representation of $P$ on $L^2(H^d)$ is defined by

$$U_{(z,t,\rho)}f(z',t') = \rho^{-(d+1)}f\left(\frac{z' - z}{\rho} - \frac{t' - t - 2 \Im \bar{z}z'}{\rho^2}\right).$$  \hspace{1cm} (2.1)

Let $R^+$ denote the set of all positive real numbers, $R^- = -R^+$. Let $P_\alpha (\alpha \in (Z^+)^d)$ be the projection from $L^2(R^d)$ to 1-dimensional subspace spanned by $E_\alpha$, and let $\sigma = +$ or $-$,

$$H^\sigma_\alpha = \left\{ f \in L^2(H^d) : \tilde{f}(\lambda) = \tilde{f}(\lambda)P_\alpha, \text{ and } \tilde{f}(\lambda) = 0 \text{ if } \lambda \notin R^\sigma \right\}. \hspace{1cm} (2.2)$$

From [15, Theorem 1], we have

$$L^2(H^d) = \bigoplus_{\alpha \in (Z^+)^d} (H^+_\alpha \oplus H^-_\alpha). \hspace{1cm} (2.3)$$

Let $\alpha \in (Z^+)^d$ and $\sigma = +$ or $-$, $\phi \in H^\sigma_\alpha$; if $\phi \neq 0$ and satisfies

$$C_\phi = \left\langle \int_{R^\sigma} \tilde{\phi}(\lambda)^* \tilde{\phi}(\lambda) \frac{d\lambda}{|\lambda|} E_\alpha, E_\alpha \right\rangle < +\infty, \hspace{1cm} (2.4)$$

then we call $\phi$ an admissible wavelet and write $\phi \in AW^\sigma_\alpha$. Let $\phi \in AW^\sigma_\alpha$, $f \in H^\sigma_\alpha$; the continuous wavelet transform of $f$ with respect to $\phi$ is defined by

$$W_\phi f(z,t,\rho) = \left\langle f, U_{(z,t,\rho)}\phi \right\rangle_{L^2(H^d)}. \hspace{1cm} (2.5)$$

And the following Calderón reproducing formula holds in the weak sense:

$$f(z',t') = C_\phi^{-1} \int_0^{+\infty} \int_{H^d} W_\phi f(z,t,\rho)U_{(z,t,\rho)}\phi(z',t') \frac{dz \, dt \, d\rho}{\rho^{2d+3}}. \hspace{1cm} (2.6)$$

2.1. Calderón Reproducing Formula in $L^2(H^d)$

By (1.16) and (1.18), we can rewrite (2.5) and (2.6) as follows:

$$W_\phi f(z,t,\rho) = \rho^{d+1} f * \widetilde{\phi_\rho}(z,t), \hspace{1cm} (2.7)$$

$$f(z,t) = C_\phi^{-1} \int_0^{+\infty} f * \phi_\rho \ast \phi_\rho(z,t) \, d\rho. \hspace{1cm} (2.8)$$
For $0 < \varepsilon < \eta < +\infty$, let

$$f_{\varepsilon,\eta}(z,t) = C^{-1}_\phi \int_\varepsilon^\eta f \ast \phi_\rho \ast \bar{\phi}_\rho(z,t) \frac{d\rho}{\rho},$$

(2.9)

$$\Phi_{\varepsilon,\eta}(z,t) = C^{-1}_\phi \int_\varepsilon^\eta \phi_\rho \ast \bar{\phi}_\rho(z,t) \frac{d\rho}{\rho},$$

(2.10)

then $f_{\varepsilon,\eta}(z,t) = f \ast \Phi_{\varepsilon,\eta}(z,t)$. We are now in a position to show that $f_{\varepsilon,\eta}$ converges to $f$ in $L^2$-space when $\varepsilon \to 0$ and $\eta \to \infty$. The result in this paper is an extension of that of Mourou and Trimèche [19].

**Lemma 2.1.** Suppose that $\phi \in AW^\alpha_\sigma$ and $\hat{\phi} \in H^\alpha_\sigma$ satisfies $\hat{\phi}(\lambda) \in S(\mathcal{K})$. Let $\Phi_{\varepsilon,\eta}$ be defined by (2.10). Then one has $\Phi_{\varepsilon,\eta} \in L^2(\mathcal{H}^d)$.

**Proof.** By Hölder’s inequality, we have

$$|\Phi_{\varepsilon,\eta}|^2 \leq C^{-2}_\phi \int_\varepsilon^\eta |\phi_\rho \ast \bar{\phi}_\rho(z,t)|^2 \frac{d\rho}{\rho} \int_\varepsilon^\eta \frac{d\rho}{\rho}.$$  

(2.11)

Thus

$$\int_{\mathcal{H}^d} |\Phi_{\varepsilon,\eta}|^2 dz dt \leq C^{-2}_\phi \int_\varepsilon^\eta \int_{\mathcal{H}^d} |\phi_\rho \ast \bar{\phi}_\rho(z,t)|^2 \frac{dz dt}{\rho} \int_\varepsilon^\eta \frac{d\rho}{\rho}.$$  

(2.12)

By (1.14), (1.19), and (1.20), we have

$$\int_{\mathcal{H}^d} |\phi_\rho \ast \bar{\phi}_\rho(z,t)|^2 dz dt = \frac{2^{d-1}}{\pi^{d+1}} \int_{-\infty}^{+\infty} \left\| \hat{\phi}(\rho \lambda) \hat{\phi}(\rho \lambda)^* \right\|^2_1 |\lambda|^d d\lambda$$

$$\quad = \frac{2^{d-1}}{\pi^{d+1}} \int_{-\infty}^{+\infty} \text{tr} \left( \hat{\phi}(\rho \lambda)^* \hat{\phi}(\rho \lambda) \hat{\phi}(\rho \lambda)^* \hat{\phi}(\rho \lambda) \right) |\lambda|^d d\lambda.$$  

(2.13)

Noticing that

$$\text{tr} \left( \hat{\phi}(\rho \lambda)^* \hat{\phi}(\rho \lambda) \hat{\phi}(\rho \lambda)^* \hat{\phi}(\rho \lambda) \right) = \sum_a \left( \hat{\phi}(\rho \lambda)^* \hat{\phi}(\rho \lambda) E_a \hat{\phi}(\rho \lambda)^* \hat{\phi}(\rho \lambda) E_a \right)_{\mathcal{K}'}$$

(2.14)

we obtain

$$\text{tr} \left( \hat{\phi}(\rho \lambda)^* \hat{\phi}(\rho \lambda) \hat{\phi}(\rho \lambda)^* \hat{\phi}(\rho \lambda) \right) \leq \left\| \hat{\phi}(\rho \lambda) \right\|^2_1 \text{tr} \left( \hat{\phi}(\rho \lambda)^* \hat{\phi}(\rho \lambda) \right).$$  

(2.15)
Mathematical Problems in Engineering

Thus we get

\[
\int_{H^d} \left| \phi_r \ast \hat{\phi}_r(z,t) \right|^2 dz \, dt \leq \frac{2^{d-1}}{\pi^{d+1}} \int_{-\infty}^{\infty} \left\| \hat{\phi} \right\|_{L_2(H^d)}^2 \, d\lambda \, \left| \lambda \right|^d d\lambda = \frac{2^{d-1}}{\pi^{d+1}} \left\| \hat{\phi} \right\|_{L_2(H^d)}^2 \, d\lambda \left( \frac{2^{2d}}{\pi^{2d+1}} \right) \left| \lambda \right|^d d\lambda = \left\| \hat{\phi} \right\|_{L_2(H^d)}^2 \left\| \phi_r \right\|_{L^2(H^d)}^2.
\]

Therefore,

\[
\int_{H^d} \left| \Phi_{\epsilon,\eta} \right|^2 dz \, dt \leq C_\phi^{-2} \int_{\epsilon}^{\eta} \left\| \hat{\phi} \right\|_{L_2(H^d)}^2 \left\| \phi_r \right\|_{L^2(H^d)}^2 \, d\rho \left( \frac{\eta^d - \epsilon^d}{\epsilon^d} \right) \left( \frac{\eta^{d+1} - \epsilon^{d+1}}{\epsilon^{d+1}} \right) \leq C_\phi^{-2} \left\| \hat{\phi} \right\|_{L_2(H^d)}^2 \left\| \phi_r \right\|_{L^2(H^d)}^2 \left( \frac{\eta^d - \epsilon^d}{\epsilon^d} \right) \left( \frac{\eta^{d+1} - \epsilon^{d+1}}{\epsilon^{d+1}} \right) \leq \frac{C_\phi^{-2} \eta^{d+1} - \epsilon^{d+1}}{\epsilon^{d+1}} \left\| \hat{\phi} \right\|_{L_2(H^d)}^2 \left\| \phi_r \right\|_{L^2(H^d)}^2.
\]

Then we complete the proof of this lemma.

**Theorem 2.2.** Let \( \phi \in AW^n_a \) and \( \phi \in H_2^a \) satisfy \( \hat{\phi}(\lambda) \in S(\mathbb{R}) \). Then for \( f \in H_2^a \), one has \( f_{\epsilon,\eta} \in L^2(H^d) \) and \( \lim_{\epsilon \to 0, \eta \to \infty} f_{\epsilon,\eta} = f \).

**Proof.** Notice that

\[
f_{\epsilon,\eta}(z,t) = f \ast \Phi_{\epsilon,\eta}(z,t),
\]

and by (1.19) and Lemma 2.1 we deduce \( f_{\epsilon,\eta} \in L^2(H^d) \). Then by (1.17) and (1.19), we have

\[
\lim_{\eta \to \infty} \left( \int_{H^d} f_{\epsilon,\eta}(z,t) \pi_1(z,t) dz \, dt \right)_{\mathcal{E}} = \lim_{\eta \to \infty} \left( \int_{H^d} f \ast \Phi_{\epsilon,\eta}(z,t) \pi_1(z,t) dz \, dt \right)_{\mathcal{E}} = \lim_{\eta \to \infty} \left( C^{-1}_\phi \int_{\epsilon}^{\eta} \hat{f}(\lambda) \hat{\phi}(\rho \lambda) \frac{d\rho \epsilon}{\rho} \right)_{\mathcal{E}} = \lim_{\eta \to \infty} \left( C^{-1}_\phi \int_{\epsilon}^{\eta} \hat{\phi}^* \hat{\phi} \frac{d\lambda}{|\lambda|} \right)_{\mathcal{E}} \left( \hat{f}(\lambda) \right)_{\mathcal{E}} \left( \hat{f}(\lambda) \right)_{\mathcal{E}} = \left( \hat{f}(\lambda) \right)_{\mathcal{E}} \left( \hat{f}(\lambda) \right)_{\mathcal{E}}.
\]

where \( \sigma = + \) if \( \lambda > 0 \), otherwise \( \sigma = - \). By (1.11) we get the desired result.
2.2. Calderón Reproducing Formula in $L^p(\mathbb{H}^d)$ with $1 < p < \infty$

For $f \in L^p(\mathbb{H}^d)$ with $1 < p < \infty$, the continuous wavelet transform of $f$ with respect to a wavelet $\phi$ can be defined by formula (2.7) under certain conditions on $\phi$. In this part we will show that $f_{\varepsilon,\eta}$ converges to $f$.

Let $f$ be a measurable function on $\mathbb{H}^d$; for $(z,t) \in \mathbb{H}^d$, define

$$f^*(z,t) = \text{ess sup}\left\{|f(z',t')| : (z',t') \in \mathbb{H}^d, \ |(z',t')| > |(z,t)| \right\}. \tag{2.20}$$

It is easy to see that $f^*$ is nonnegative and radially decreasing, that is,

$$0 \leq f^*(z_1,t_1) \leq f^*(z_2,t_2) \quad \text{only if} \quad |(z_1,t_1)| > |(z_2,t_2)|, \tag{2.21}$$

and $f^* \geq |f|$ a.e. on $\mathbb{H}^d$.

Let $g \in L^1(\mathbb{R}^+)$. Then for any $(z,t) \in \mathbb{H}^d$, we define

$$G^*(z,t) = \sup\left\{\rho^{-(2d+2)} \left| \int_\rho^{+\infty} g(s) ds \right| : \rho > |(z,t)| \right\}, \tag{2.22}$$

and thus we have the following lemma.

**Lemma 2.3.** Let $g \in L^1(\mathbb{R}^+)$ and $G^*(z,t)$ be defined by (2.22). Then one has

$$\int_{\mathbb{H}^d \setminus \mathcal{B}} G^*(z,t) dz \ dt \leq c \int_1^{+\infty} |g(s)| \ln s \ ds, \tag{2.23}$$

where $c$ is a positive constant, $\mathcal{B} = \mathcal{B}((0,0),1)$.

**Proof.** First we let

$$G(z,t) = |(z,t)|^{-(2d+2)} \int_{|(z,t)|}^{+\infty} |g(s)| ds. \tag{2.24}$$

It is obvious that $G^*(z,t) \leq G(z,t)$ for any $(z,t) \in \mathbb{H}^d \setminus \{(0,0)\}$. Since $G(z,t)$ is nonnegative and radially decreasing, from [11, page 542], we know that there exists a positive constant $c$ such that

$$\int_{\mathbb{H}^d} G(z,t) dz \ dt = c \int_0^{+\infty} G(r) r^{2d+1} dr. \tag{2.25}$$
Thus,

\[
\int_{H^d \backslash B} G'(z, t) dz dt \leq \int_{H^d \backslash B} G(z, t) dz dt
\]

\[
= c \int_1^{\infty} G(r)r^{2d+1} dr
\]

\[
= c \int_1^{\infty} r^{-(2d+2)} \int_r^{\infty} |g(s)| ds r^{2d+1} dr
\]

\[
= c \int_1^{\infty} \int_1^s |g(s)| ds \frac{dr}{r}
\]

\[
= c \int_1^{\infty} |g(s)| \ln s \, ds.
\]  

(2.26)

This completes the proof. \qed

Let \(k\) be a radial function in \(L^p(H^d)\) (\(1 < p < \infty\)) and let

\[
K(z, t) = |(z, t)|^{-(2d+2)} \int_0^{|(z, t)|} k(s\omega) s^{2d+1} ds
\]  

(2.27)

for any \((z, t) \in H^d \backslash \{(0,0)\}\), where \(\omega\) is a unit vector of \(H^d\). Then we have the following lemma.

**Lemma 2.4.** Let \(k\) be a radial function in \(L^p(H^d)\) (\(1 < p < \infty\)) and let \(K(z, t)\) be defined by \(k\) in (2.27). If \(k\) satisfies \(\int_{H^d} k(z, t) dz dt = 0\), and \(k(z, t) \ln |(z, t)| \in L^1(H^d)\), then \(K \in L^1(H^d)\).

**Proof.** Analogous to (2.20) we define

\[
K^*(z, t) = \text{ess sup}\left\{ |K(z', t')| : (z', t') \in H^d, \ |(z', t')| > |(z, t)| \right\},
\]  

(2.28)

and then \(K^* \geq |K|\) a.e. on \(H^d\).
Let \((z, t), (z', t') \in \mathbb{H}^d\) and \(0 < ||(z, t)|| < ||(z', t')||\); by (2.25) we have

\[
|K(z', t')| = \frac{1}{||(z', t')||^{d+2}} \left| k(s \omega) s^{2d+1} ds \right| \leq \frac{1}{||(z', t')||^{d+2}} \int_0^{||(z', t')||} |k(s \omega)| s^{2d+1} ds
\]

\[
= \frac{1}{c||(z', t')||^{d+2}} \int_{B((0,0), ||(z', t')||)} |k(z'', t'')| d z'' dt'' \leq \frac{2^{2d+2}}{c||(z, t)|| + ||(z', t')||^{d+2}} \int_{B((z, t), ||(z, t)|| + ||(z', t')||)} |k(z'', t'')| d z'' dt'' \leq 2^{2d+2} (Mk)(z, t),
\]

where \(Mk\) is the Hardy-Littlewood maximal function of \(k\). From the definition of \(K^*\), we have \(K^* \leq 2^{2d+2} (Mk)\). Because \(k \in L^p(\mathbb{H}^d)\), we get \(K^* \in L^p(\mathbb{H}^d)\).

By the hypothesis \(k\) is radial and \(\int_{\mathbb{H}^d} k(z, t) dz dt = 0\); together with the definition of \(K\), we have

\[
|K(z, t)| = \frac{1}{||z, t||^{d+2}} \left| k(s \omega) s^{2d+1} ds \right|. \quad (2.30)
\]

Since \(k(z, t)(\ln ||z, t||) \in L^1(\mathbb{H}^d)\), it follows from Lemma 2.3 that \(\int_{\mathbb{H}^d \setminus B} K^*(z, t) dz dt < +\infty\), that is, \(K^* \in L^1_{\text{loc}}(\mathbb{H}^d)\). On the other hand, \(K^* \in L^p(\mathbb{H}^d) \subseteq L^1_{\text{loc}}(\mathbb{H}^d)\), and thus \(K^* \in L^1(\mathbb{H}^d)\), which implies that \(K \in L^1(\mathbb{H}^d)\). \(\square\)

Without loss of generality, we assume that \(C_p = 1\); then (2.9) and (2.10) can be written as

\[
\Phi_{\varepsilon, \eta}(z, t) = \int_{\varepsilon}^{\eta} \phi_{\rho} \star \tilde{\phi}_{\rho}(z, t) \frac{d \rho}{\rho}, \quad (2.31)
\]

\[
f_{\varepsilon, \eta}(z, t) = \int_{\varepsilon}^{\eta} f \star \phi_{\rho} \star \tilde{\phi}_{\rho}(z, t) \frac{d \rho}{\rho}. \quad (2.32)
\]

In fact, \(\Phi_{\varepsilon, \eta}\) is always stated under conditions on \(k := \phi \star \tilde{\phi}\) rather than under conditions on \(\phi\) for convenience (see [4, 10]). By Lemma 2.4 we have the following theorem.

**Theorem 2.5.** Let \(k\) be in the conditions of Lemma 2.4 and let \(K\) be defined by (2.27). Suppose \(\phi \star \tilde{\phi} = k\) and \(\int_{\mathbb{H}^d} K(z, t) dz dt = 1\). Then for \(f \in L^p(\mathbb{H}^d)\), one has \(\lim_{\varepsilon \to 0, \eta \to \infty} f_{\varepsilon, \eta} = f\).

**Proof.** From (2.31) we have

\[
\Phi_{\varepsilon, \eta}(z, t) = \Phi_{\varepsilon, \infty}(z, t) - \Phi_{\eta, \infty}(z, t). \quad (2.33)
\]
Since \( k(z, t) = \phi \ast \tilde{\phi}(z, t) \), and \( \tilde{\phi}(z, t) = \bar{\phi}(-z, -t) \), we deduce

\[
\begin{align*}
    k_p(z, t) &= \rho^{-(2d+2)} \int_{\mathcal{H}^d} \phi'(z', t') \phi \left( \left( \rho^{-1} z, \rho^{-2} t \right)^{-1} (z', t') \right) dz'dt' \\
    &= \rho^{-(4d+4)} \int_{\mathcal{H}^d} \phi'(z', t') \phi \left( \rho^{-1} \left( (z, t)^{-1} \left( \rho z', \rho^2 t' \right) \right) \right) d(\rho z') d(\rho^2 t') \\
    &= \rho^{-(4d+4)} \int_{\mathcal{H}^d} \phi \left( \rho^{-1} (z', t') \right) \tilde{\phi} \left( \rho^{-1} \left( (z, t)^{-1} (z', t') \right) \right) dz'dt' \\
    &= \phi_p \ast \tilde{\phi}_p(z, t).
\end{align*}
\]

Then we have

\[
\begin{align*}
    \Phi_{\epsilon, \infty}(z, t) &= \int_{\mathcal{H}^d} k_p(z, t) \frac{d\rho}{\rho} \\
    &= \int_{\mathcal{H}^d} \left( \frac{z, t}{\rho} \right) \frac{d\rho}{\rho^{2d+3}} \\
    &= \frac{1}{|\langle z, t \rangle|^{2d+2}} \int_{|\langle z, t \rangle| / \epsilon}^{\infty} k \left( \frac{\rho}{|\langle z, t \rangle|} \right) \frac{d\rho}{\rho^{2d+3}} \\
    &= \frac{1}{|\langle z, t \rangle|^{2d+2}} \int_{|\langle z, t \rangle| / \epsilon}^{\infty} k \left( \frac{\rho}{|\langle z, t \rangle|} \right) \rho^{2d+1} d\rho \\
    &= \frac{\epsilon^{-2(d+1)}}{|\langle z, t \rangle|^{2d+2}} \int_{|\langle z, t \rangle| / \epsilon}^{\infty} k(\rho \omega) \rho^{2d+1} d\rho \\
    &= K_{\epsilon}(z, t).
\end{align*}
\]

By Lemma 2.4 together with the approximation of the identity, we have

\[
\begin{align*}
    \lim_{\epsilon \to 0} f_{\epsilon, \eta}(z, t) = \lim_{\eta \to \infty} \Phi_{\epsilon, \eta} \ast f(z, t) = \lim_{\eta \to \infty} K_{\epsilon} \ast f(z, t) - \lim_{\eta \to \infty} K_{\eta} \ast f(z, t) = f(z, t). \tag{2.36}
\end{align*}
\]

Then we complete the proof of this theorem.
