THE BANACH ALGEBRA $\mathcal{B}(X)$, WHERE $X$ IS A BK SPACE AND APPLICATIONS

Bruno de Malafosse

Abstract. In this paper we give some properties of Banach algebras of bounded operators $\mathcal{B}(X)$, when $X$ is a BK space. We then study the solvability of the equation $Ax = b$ for $b \in \{s_\alpha, s^{(c)}_\alpha, l_p(\alpha)\}$ with $\alpha \in U^+$ and $1 \leq p < \infty$. We then deal with the equation $T_\alpha x = b$, where $b \in X(\Delta^k)$ for $k \geq 1$ integer, $\chi \in \{s_\alpha, s^{(c)}_\alpha, l_p(\alpha)\}$, $1 \leq p < \infty$ and $T_\alpha$ is a Toeplitz triangle matrix. Finally we apply the previous results to infinite tridiagonal matrices and explicitly calculate the inverse of an infinite tridiagonal matrix. These results generalize those given in [4, 9].

1. Preliminary results

Let $A = (a_{nm})_{n,m \geq 1}$ be an infinite matrix and consider the sequence $x = (x_n)_{n \geq 1}$. We will define the product $Ax = (A_n(x))_{n \geq 1}$ with $A_n(x) = \sum_{m=1}^{\infty} a_{nm} x_m$ whenever the series are convergent for all $n \geq 1$. Throughout this paper we use the convention that any term with subscript less than 1 is equal to naught. Let $s$ denote the set of all complex sequences. We write $\varphi$, $c_0$, $c$ and $l_\infty$ for the sets of finite, null, convergent and bounded sequences respectively. For any given subsets $X$, $Y$ of $s$, we shall say that the operator represented by the infinite matrix $A = (a_{nm})_{n,m \geq 1}$ maps $X$ into $Y$, that is $A \in (X,Y)$, see [5], if

i) the series defined by $A_n(x) = \sum_{m=1}^{\infty} a_{nm} x_m$ are convergent for all $n \geq 1$ and for all $x \in X$;

ii) $Ax \in Y$ for all $x \in X$.

For any subset $X$ of $s$, we shall write

$$AX = \{ y \in s : \text{there is } x \in X, \ y = Ax \}.$$ 

If $Y$ is a subset of $s$, we shall denote the so-called matrix domain by

$$Y(A) = \{ x \in s : y = Ax \in Y \}.$$ 

AMS Subject Classification: 40C05, 46A45

Keywords and phrases: Infinite linear system, sequence space, BK space, Banach algebra, bounded operator.
Let $X \subset s$ be a Banach space, with norm $\| \cdot \|_X$. By $\mathcal{B}(X)$ we will denote the set of all bounded linear operators, mapping $X$ into itself. We shall say that $A \in \mathcal{B}(X)$ if and only if $A : X \to X$ is a linear operator and
\[
\|A\|_{\mathcal{B}(X)} = \sup_{\|x\|_X \neq 0} (\|Ax\|/\|x\|_X) < \infty.
\]
It is well known that $\mathcal{B}(X)$ is a Banach algebra with the norm $\|A\|_{\mathcal{B}(X)}$, see [1]. A Banach space $X \subset s$ is a BK space if the projection $P_n : x \mapsto x_n$ from $X$ into $\mathbb{C}$ is continuous for all $n$. A BK space $X \supseteq \varphi$ is said to have AK if for every $x \in X$, $x = \lim_{n \to \infty} \sum_{k=1}^{p} x_k e_k$, where $e_k = (0, \ldots, 1, \ldots, 1$ being in the $k$-th position. It is well known that if $X$ has AK then $\mathcal{B}(X) = (X, X)$, see [19]. In the following we shall explicitly give some new properties of particular algebras.

2. The set $\mathcal{B}(l_p(\alpha))$ for $1 \leq p \leq \infty$

2.1. The set $\mathcal{B}(l_p(\alpha))$ for $p \geq 1$ real

Put now
\[
U^+ = \{ x = (x_n)_{n \geq 1} \in s : x_n > 0 \text{ for all } n \}. \]

Recall that $l_p$, for $p > 0$ is the set of sequences $x = (x_n)_{n \geq 1}$ such that $\sum_{n=1}^{\infty} |x_n|^p < \infty$. Using Wilansky's notations [21], for any given $\alpha = (\alpha_n)_{n \geq 1} \in U^+$ and $p \geq 1$ real we have
\[
l_p(\alpha) = \left( \frac{1}{\alpha} \right)^{-1} * l_p = \left\{ x \in s : \sum_{n=1}^{\infty} \left( \frac{|x_n|}{\alpha_n} \right)^p < \infty \right\}. \]

Define the diagonal matrix $D_\xi = (\xi_n \delta_{nm})_{n,m \geq 1}$, (where $\delta_{nm} = 0$ for all $n \neq m$ and $\delta_{nm} = 1$ otherwise), we then have $D_\alpha l_p = l_p(\alpha)$. It is easy to see that $l_p(\alpha)$ is a Banach space with the norm
\[
\|x\|_{l_p(\alpha)} = \|D_\alpha x\|_{l_p} = \left[ \sum_{n=1}^{\infty} \left( \frac{|x_n|}{\alpha_n} \right)^p \right]^\frac{1}{p}. \]

We have the following lemma.

**Lemma 1.** Let $\alpha = (\alpha_n)_{n \geq 1}$, $\beta = (\beta_n)_{n \geq 1} \in U^+$ and $p \geq 1$ a real. The condition $\alpha/\beta \in l_\infty$ implies that $l_p(\alpha) \subset l_p(\beta)$.

**Proof.** Since $p \geq 1$, we get $\alpha/\beta \in l_\infty$ if and only if $(\alpha/\beta)^p \in l_\infty$ and for all $x \in l_p(\alpha)$
\[
\|x\|^p_{l_p(\beta)} = \sum_{n=1}^{\infty} \left( \frac{|x_n|}{\alpha_n} \cdot \frac{\alpha_n}{\beta_n} \right)^p \leq \sup_{n \geq 1} \left[ \left( \frac{\alpha_n}{\beta_n} \right)^p \right] \|x\|^p_{l_p(\alpha)}. \]

This gives the conclusion. □

We also have $l_p(\alpha) \subset l_p(\alpha)$ for $1 \leq p \leq p'$.

As we will see later, $l_p(\alpha)$ has AK, so $\mathcal{B}(l_p(\alpha)) = (l_p(\alpha), l_p(\alpha))$ and $\mathcal{B}(l_p(\alpha))$ is a Banach algebra with identity. So we get
\[
\|Ax\|_{l_p(\alpha)} \leq \|A\|_{\mathcal{B}(l_p(\alpha))} \|x\|_{l_p(\alpha)} \text{ for all } x \in l_p(\alpha). \]
We have \( l_p = l_p(e) \), where \( e = (1, \ldots, 1, \ldots) \) and
\[
\|D_{1/n} AD_\alpha\|_{l_p(e)} = \|A\|_{l_p(\alpha)}
\]
for all \( A \in B(l_p(\alpha)) \).

Indeed, writing \( D_\alpha x = y \), we get
\[
\sup_{x \neq 0} \left( \frac{\|D_{1/n} AD_\alpha x\|_{l_p}}{\|x\|_{l_p}} \right) = \sup_{y \neq 0} \left( \frac{\|D_{1/n} Ay\|_{l_p}}{\|D_{1/n} y\|_{l_p}} \right) = \|A\|_{l_p(\alpha)}.
\]

So we can say that \( A \in B(l_p(\alpha)) \) if and only if \( D_{1/n} AD_\alpha \in B(l_p) \). When \( \alpha = (r^n)_{n \geq 1} \), for a given real \( r > 0 \), \( l_p(\alpha) \) is denoted \( l_p(r) \). When \( p = \infty \), we obtain the next results.

2.2. The case \( p = \infty \) and Banach algebra \( S_\alpha \)

Let \( \alpha = (\alpha_n)_{n \geq 1} \in U^+ \). Using Wilansky’s notation [20], we have \( l_\infty(\alpha) = (1/\alpha)^{-1} * l_\infty = D_{\alpha l_\infty} \). We will write
\[
s_\alpha = l_\infty(\alpha) = \{ x \in s : x_n/\alpha_n = O(1) \ (n \to \infty) \},
\]
see [6–15]. The set \( s_\alpha \) is a Banach space with the norm \( \|x\|_{s_\alpha} = \sup_n (\|x_n/\alpha_n\|) \).

The set
\[
S_\alpha = \left\{ A = (a_{nm})_{n,m \geq 1} : \sup_{n \geq 1} \left( \sum_{m=1}^{\infty} |a_{nm}| \frac{\alpha_m}{\alpha_n} \right) < \infty \right\},
\]
is a Banach algebra with identity normed by
\[
\|A\|_{S_\alpha} = \sup_{n \geq 1} \left( \sum_{m=1}^{\infty} |a_{nm}| \frac{\alpha_m}{\alpha_n} \right).
\]

Recall that if \( A \in (s_\alpha, s_\alpha) \), then \( \|Ax\|_{s_\alpha} \leq \|A\|_{S_\alpha} \|x\|_{s_\alpha} \) for all \( x \in s_\alpha \). Thus we obtain the following result where we put \( B(s_\alpha) = B(s_\alpha) \cap (s_\alpha, s_\alpha) \).

**Lemma 2.** For any given \( \alpha \in U^+ \) we have \( B(s_\alpha) = S_\alpha = (s_\alpha, s_\alpha) \).

As we have seen above when \( \alpha = (r^n)_{n \geq 1}, r > 0 \), \( s_\alpha \) and \( s_\alpha \) are denoted \( S_r \) and \( s_r \). When \( r = 1 \), \( s_1 = l_\infty \) is the set of all bounded sequences.

Recall [14] that \( s_\alpha = s_\beta \) if and only if there are \( K_1, K_2 > 0 \) such that \( K_1 \leq \alpha_n/\beta_n \leq K_2 \) for all \( n \).

In the same way we will define the sets
\[
s_\alpha^o = \left\{ x \in s : \frac{x_n}{\alpha_n} = o(1) \ (n \to \infty) \right\}
\]
and
\[
s_\alpha^{(c)} = \left\{ x \in s : \frac{x_n}{\alpha_n} \to l \ (n \to \infty) \text{ for some } l \right\}.
\]

The sets \( s_\alpha^o \) and \( s_\alpha^{(c)} \) are Banach spaces with the norm \( \|\cdot\|_{s_\alpha} \).
3. New Banach algebras

3.1. The Banach algebra $\mathcal{B}(\chi)$ for $\chi \in \{s_\alpha, s_\alpha^\circ, s_\alpha^{(c)}, l_p(\alpha)\}$ with $1 \leq p < \infty$

In this section we will give an explicit expression for the norm $\|A\|_{\mathcal{B}(l_p(\alpha))}$ for $1 \leq p \leq \infty$ and give some properties of the equation $Ax = b$ for $A \in \mathcal{B}(\chi)$, $b \in \chi$ with $\chi \in \{s_\alpha, s_\alpha^\circ, s_\alpha^{(c)}, l_p(\alpha)\}$ and $1 \leq p < \infty$.

We have the next result where $U$ is the set of all sequences $u = (u_n)_{n \geq 1}$ with $u_n \neq 0$ for all $n$ and $L$ is the set of lower triangular infinite matrices, (that is $A \in L$ if $a_{nm} = 0$ for $m > n$).

**Lemma 3.** i) Let $T \in L$ be a triangle, that is $t_{nn} \neq 0$ for all $n$, and $X$ a BK space. Then $X(T)$ is a BK space with the norm

$$\|x\|_{X(T)} = \|Tx\|_X.$$  \hspace{1cm} (3)

ii) Let $T = D_\alpha = (a_n\delta_{nm})_{n,m \geq 1}$ be a diagonal matrix with $a \in U$ and $X$ a BK space with AK. Then $X(T)$ has AK with the norm given by (3).

**Proof.** i) was shown in [17] and ii) comes from [20, Theorem 4.3.6 pp. 52].

We then have the following result.

**Lemma 4.** i) Let $\alpha \in U^+$. Then $s_\alpha$, $s_\alpha^\circ$ and $s_\alpha^{(c)}$ are BK spaces with the norm $\|\cdot\|_{s_\alpha}$ and $s_\alpha^\circ$ has AK. The set $l_p(\alpha)$ for $1 \leq p < \infty$ is a BK space and has AK with the norm $\|\cdot\|_{l_p(\alpha)}$.

ii) Let $\chi$ be any of the spaces $s_\alpha$, $s_\alpha^\circ$, or $s_\alpha^{(c)}$. Then

$$|P_n(x)| = |x_n| \leq \alpha_n \|x\|_{s_\alpha} \text{ for all } n \geq 1 \text{ and for all } x \in \chi.$$  

**Proof.** i) First we have $s_\alpha = s_1(D_{1/\alpha})$, since $x \in s_\alpha$ if and only if $D_{1/\alpha}x = x/\alpha \in s_1$. It is well known that $s_1$ is a BK space with respect to the norm $\|\cdot\|_{s_1}$, so by Lemma 3, the set $s_1(D_{1/\alpha})$ is also a BK space with

$$\|x\|_{s_1(D_{1/\alpha})} = \|D_{1/\alpha}x\|_{s_1} = \|x\|_{s_\alpha}.$$

We also have $s_\alpha^\circ = c_0(D_{1/\alpha})$ and $s_\alpha^{(c)} = c(D_{1/\alpha})$. We conclude since $c_0$ and $c$ are BK spaces with respect to the norm $\|\cdot\|_{s_1}$, and $c_0$ has AK. Finally $l_p$ for $1 \leq p < \infty$ being a BK space with AK, it follows that $l_p(\alpha) = l_p(D_{1/\alpha})$ also has AK.

ii) is a direct consequence of the definition of the sets $s_\alpha$, $s_\alpha^\circ$, and $s_\alpha^{(c)}$.  

**Remark 1.** Note that if $X$ is a BK space with the norm $\|\cdot\|_X$, then

$$(X, X) \subset \mathcal{B}(X).$$

Indeed, by [17 Theorem 4.2.8 p. 57], since $X$ is a BK space, the matrix map $A \in (X, X)$ is continuous and there is $M > 0$ such that

$$\|Ax\|_X \leq M\|x\|_X \text{ for all } x \in X.$$
To obtain other results we require some definitions and lemmas. We will write $B_X(0, 1) = \{ x \in X : \|x\|_X \leq 1 \}$ for the unit ball, where $X$ is any given BK space. Thus we get
$$\|A\|_{\mathcal{B}(X)} = \sup_{x \neq 0}(\|Ax\|_X / \|x\|_X) = \sup_{x \in B_X(0, 1)}(\|Ax\|_X) \text{ for all } A \in \mathcal{B}(X).$$

Recall that for all $a = (a_n)_{n \geq 1} \in X$ such that the series $\sum_{n=1}^{\infty} a_n x_n$ is convergent for all $x \in X$ the identity
$$\|a\|_X = \sup_{x \in B_X(0, 1)} \left( \left\| \sum_{n=1}^{\infty} a_n x_n \right\| \right)$$
is defined and finite. In Malkowsky [17], we have

**Lemma 5.** Let $X$ be a BK space. Then $A \in (X, l_\infty)$ if and only if
$$\sup_{n \geq 1}(\|A_n\|_X) = \sup_{n \geq 1} \left( \sup_{x \in B_X(0, 1)} \left\| \sum_{n=1}^{\infty} a_n x_n \right\| \right) < \infty.$$

We also have, (cf. [17, Theorem 1.2.3, p. 155]),

**Lemma 6.** For every $a \in l_1$, $\|a\|_c^* = \|a\|_c^* = \|a\|_{l_\infty} = \|a\|_{l_1} = \sum_{n=1}^{\infty} |a_n|$. It can be easily deduced that if $X$ is a BK space, then $A \in (X, s_\beta)$ if and only if
$$\sup_{n \geq 1} \frac{1}{\beta_n} \left\| A_n \right\|_X < \infty.$$

Since there is no characterization of the set $(l_p(\alpha), l_p(\alpha))$ for $1 < p < \infty$ and $p \neq 2$, we need to define a subset $\mathcal{B}_p(\alpha)$ of $(l_p(\alpha), l_p(\alpha))$ permitting us to obtain the inverse of some well chosen matrix map $A \in (l_p(\alpha), l_p(\alpha))$. In this way we are led to define the number
$$N_{p, \alpha}(A) = \left\{ \left( \sum_{n=1}^{\infty} \left( \sum_{m=1}^{\infty} |a_{nm}|^{2q} / a_{nm}^q \right)^{q/p-1} \right)^{\frac{1}{q^2}} \right\},$$
for $1 < p < \infty$ and $q = p/(p-1)$. Thus we can state the following

**Proposition 7.** Let $\alpha \in U^+$. Then

i) for every $A \in S_\alpha$
$$\|A\|_{\mathcal{B}(\alpha)} = \|A\|_{S_\alpha} = \sup_{n \geq 1} \left( \sum_{m=1}^{\infty} |a_{nm}|^{2q} / a_{nm}^q \right);$$

ii) a) $\mathcal{B}(l_1(\alpha)) = (l_1(\alpha), l_1(\alpha))$ and $A \in \mathcal{B}(l_1(\alpha))$ if and only if $A^t \in S_{1/\alpha}$.

b) $\|A\|_{\mathcal{B}(l_1(\alpha))} = \|A^t\|_{S_{1/\alpha}}$ for all $A \in \mathcal{B}(l_1(\alpha))$.

iii) For $1 < p < \infty$ we have $\hat{\mathcal{B}}_p(\alpha) \subset \mathcal{B}(l_p(\alpha))$, where
$$\hat{\mathcal{B}}_p(\alpha) = \{ A = (a_{nm})_{n,m \geq 1} : N_{p, \alpha}(A) < \infty \},$$
and for every $A \in \hat{\mathcal{B}}_p(\alpha)$, $\|A\|_{\mathcal{B}(l_p(\alpha))} \leq N_{p, \alpha}(A)$.
Proof. i) First we have

$$\|Ax\|_{s_\alpha} = \sup_{n \geq 1} \left( \frac{1}{\alpha_n} \left\| \sum_{k=1}^{\infty} a_{nk} x_k \right\| \right) = \sup_{n \geq 1} \left( \frac{1}{\alpha_n} |A_n(x)| \right) \text{ for all } x \in s_\alpha \quad (4)$$

then

$$\|A\|^*_{B(s_\alpha)} = \sup_{x \in B_{s_\alpha}(0,1)} \left( \sup_{n \geq 1} \left( \frac{1}{\alpha_n} |A_n(x)| \right) \right) = \sup_{n \geq 1} \left( \frac{1}{\alpha_n} \sup_{x \in B_{s_\alpha}(0,1)} (|A_n(x)|) \right). \quad (5)$$

Writing $x = \alpha y$ in (5) we obtain

$$\|A\|^*_{B(s_\alpha)} = \sup_{n \geq 1} \left( \frac{1}{\alpha_n} \sup_{y \in B_1(0,1)} (|A_n(\alpha y)|) \right) = \sup_{n \geq 1} \left( \frac{1}{\alpha_n} \|A_n D_\alpha \|^*_{l^\infty} \right).$$

Now by Lemma 6 we have

$$\|A_n D_\alpha \|^*_{l^\infty} = \|(a_{nk} \alpha_k)_{k \geq 1}\|_{l^1} = \sum_{k=1}^{\infty} |a_{nk} \alpha_k| \text{ for all } n.$$

We conclude that $\|A\|^*_{B(s_\alpha)} = \sup_{n \geq 1} \left( \sum_{m=1}^{\infty} |a_{nm}| \alpha_m / \alpha_n \right)$.

ii) By [17, Theorem 2.27, p. 175] we have $B(l_1) = (l_1, l_1)$ and the condition $A \in (l_1(\alpha), l_1(\alpha))$ is equivalent to $D_{1/\alpha} A D_\alpha \in (l_1, l_1)$. It is well known that $D_{1/\alpha} A D_\alpha \in (l_1, l_1)$ if and only if $(D_{1/\alpha} A D_\alpha)^* \in S_1$. This means that $D_\alpha A^* D_{1/\alpha} \in S_1$ and $A^* \in S_{1/\alpha}$. Furthermore, since $\|A\|^*_{B(l_1)} = \|A^*\|_{S_1}$, so $\|A\|^*_{B(l_1(\alpha))} = \|A^* D_{1/\alpha}\|_{S_1} = \|A^*\|_{S_{1/\alpha}}$. This permits us to conclude for ii).

iii) Let $A \in B_p(\alpha)$ be a given infinite matrix and take any $x \in l_p$. We have

$$\|Ax\|_{l_p}^p = \left( \sum_{m=1}^{\infty} |a_{nm} x_m|^p \right)^{1/p} \leq \sum_{n=1}^{\infty} \left( \sum_{m=1}^{\infty} |a_{nm} x_m|^q \right)^{\frac{1}{q}} \|x\|_{l_p},$$

and from the Hölder’s inequality, we get for every $n$

$$\sum_{m=1}^{\infty} |a_{nm} x_m| \leq \left( \sum_{m=1}^{\infty} |a_{nm}|^q \right)^{\frac{1}{q}} \left( \sum_{m=1}^{\infty} |x_m|^p \right)^{\frac{1}{p}} = \left( \sum_{m=1}^{\infty} |a_{nm}|^q \right)^{\frac{1}{q}} \|x\|_{l_p},$$

with $q = p/(1 - p)$. We deduce that

$$\|Ax\|_{l_p}^p \leq \sum_{n=1}^{\infty} \left( \sum_{m=1}^{\infty} |a_{nm}|^q \right)^{\frac{1}{q}} \|x\|_{l_p}^p = \sum_{n=1}^{\infty} \left( \sum_{m=1}^{\infty} |a_{nm}|^q \right)^{\frac{1}{q}} \|x\|_{l_p}^p,$$

and since $p/q = p - 1$, we have

$$\|Ax\|_{l_p} \leq \left[ \sum_{n=1}^{\infty} \left( \sum_{m=1}^{\infty} |a_{nm}|^q \right)^{\frac{p-1}{p}} \right]^{\frac{1}{p}} \|x\|_{l_p},$$

and

$$\|A\|^*_{B(l_p)} = \sup_{x \neq 0} \frac{\|Ax\|_{l_p}}{\|x\|_{l_p}} \leq \left[ \sum_{n=1}^{\infty} \left( \sum_{m=1}^{\infty} |a_{nm}|^q \right)^{p-1} \right]^{\frac{1}{p}}. \quad (6)$$
We have proved that if $A \in \mathcal{B}_p(e)$, then $A \in \mathcal{B}(l_p)$. So if $A \in \mathcal{B}_p(e)$ and $D_{1/\alpha}AD_{\alpha} \in \mathcal{B}_p(e)$, then $D_{1/\alpha}AD_{\alpha} \in \mathcal{B}(l_p)$ and $A$ belongs to $\mathcal{B}(l_p(\alpha))$. This concludes the proof.

### 3.2. Application to the solvability of the equation $Ax = b$

For $a = (a_{nn})_{n \geq 1} \in U$ we get the following elementary but very useful result.

**Proposition 8.** Let $X \subset s$ be a BK space. Assume that $D_{1/\alpha}A \in (X, X)$ and

$$\|I - D_{1/\alpha}A\|^2_{\mathcal{B}(X)} < 1. \quad (7)$$

Then the equation $Ax = b$ with $D_{1/\alpha}b = (b_n/a_{nn})_{n \geq 1} \in X$ admits a unique solution in $X$ given by $x = (D_{1/\alpha}A)^{-1}D_{1/\alpha}b$.

**Proof.** First we see that since $D_{1/\alpha}A \in (X, X)$ and condition $(7)$ holds, then $D_{1/\alpha}A$ is invertible in $\mathcal{B}(X)$. Since $\mathcal{B}(X)$ is a Banach algebra of operators with identity, then

$$(D_{1/\alpha}A)^{-1}(D_{1/\alpha}Ax) = [(D_{1/\alpha}A)^{-1}o(D_{1/\alpha}A)](x) = I(x) = x \quad \text{for all } x \in X.$$

Thus the equation $Ax = b$ with $D_{1/\alpha}b \in X$ is equivalent to $D_{1/\alpha}Ax = D_{1/\alpha}b$ which in turn is $x = (D_{1/\alpha}A)^{-1}(D_{1/\alpha}b) \in X$, this concludes the proof.

We can express a similar result in a more general case.

In the following we will write

$$\Gamma_\alpha = \{ A = (a_{nn})_{n,m \geq 1} \in S_\alpha : \| I - A \|_{\mathcal{B}_\alpha} < 1 \},$$

and for $1 < p < \infty$,

$$\Gamma'_{p,\alpha} = \{ A = (a_{nm})_{n,m \geq 1} \in (l_p(\alpha), l_p(\alpha)) : N_{p,\alpha}(I - A) < 1 \}, \text{ for } 1 < p < \infty.$$

Note that since $S_\alpha$ is a Banach algebra, the condition $A \in \Gamma_\alpha$ means that $A$ is invertible and $1 \in S_\alpha$.

In the following we will put $|a| = (|a_{nn}|)_{n \geq 1}$ for any given $a = (a_{nn})_{n \geq 1}$.

**Corollary 9.** Let $\alpha \in U^+$ and $A$ be an infinite matrix with $a \in U$. Assume that $D_{1/\alpha}A \in \Gamma_\alpha$. Then

i) a) for any given $b \in s_{|a|,\alpha}$, the equation $Ax = b$ admits in $s_\alpha$ a unique solution given by

$$x^0 = (D_{1/\alpha}A)^{-1}(D_{1/\alpha}b) = A^{-1}b \quad (8)$$

with $A^{-1} \in (s_{|a|,\alpha}, s_\alpha)$;

b) if $\lim_{n \to \infty} (a_{nm}/a_{nn}a_n) = 0$ for all $m \geq 1$, for any given $b \in s_{|a|,\alpha}$, the equation $Ax = b$ admits a unique solution in $s_\alpha$ given by $(8)$ and $A^{-1} \in (s_{|a|,\alpha}, s_\alpha)$;

c) if $\lim_{n \to \infty} (a_{nm}/a_{nn}a_n) = l_m$ for some $l_m$, $m \geq 1$ and

$$\lim_{n \to \infty} \left( \frac{1}{\alpha_n a_{nm}} \sum_{m=1}^{\infty} a_{nm}a_m \right) = l \quad \text{for some } l$$

(9)
then for any given $b \in s^{(c)}_{|a|_{\alpha}}$, the equation $Ax = b$ admits a unique solution in $s^{(c)}_a$ given by (8) with $A^{-1} \in (s^{(c)}_{|a|_{\alpha}}, s^{(c)}_a)$.

ii) a) If $A^{\prime}D_{1/a} \in \Gamma_{1/\alpha}$ then for given $b \in l_1 [|a|_{\alpha}]$ the equation $Ax = b$ admits a unique solution in $l_1(\alpha)$ given by (8) with $A^{-1} \in (l_1(\alpha), l_1(\alpha))$.

b) Let $p > 1$ real. If $D_{1/\alpha}A \in \Gamma_{p, \alpha}$ then for any given $b \in l_p (|a|_{\alpha})$ the equation $Ax = b$ admits a unique solution in $l_p (|a|_{\alpha})$ given by (8) with $A^{-1} \in (l_p (|a|_{\alpha}), l_p (\alpha))$.

Proof. i) By Proposition 7 ii), if $D_{1/a}A \in \Gamma_{\alpha}$, then

$$\|I - D_{1/a}A\|_{S_{\alpha}} = \|I - D_{1/a}A\|_{\mathcal{B}(S_{\alpha})} < 1.$$ 

Thus $D_{1/a}A$ is invertible in $\mathcal{B}(s_{\alpha}) \cap S_{\alpha}$. Then $(D_{1/a}A)^{-1} \in S_{\alpha}$, that is $A^{-1} \in (s_{|a|_{\alpha}}, s_{\alpha})$ and we conclude by Proposition 8.

b) The set $s_{\alpha}$ being a BK space with AK, we have $\mathcal{B}(s_{\alpha}) = (s_{\alpha}, s_{\alpha})$. Since $D_{1/a}A \in \Gamma_{\alpha}$ and $\lim_{n \to \infty} (a_{nm}/a_{nn}\alpha_n) = 0$ for all $m \geq 1$, we deduce that $D_{1/a}(D_{1/a}A)D_{\alpha} \in (c_0, c_0)$. So $D_{1/a}A \in (s_{\alpha}, s_{\alpha})$. Now by Lemma 6 we get

$$\|I - D_{1/a}A\|_{\mathcal{B}(s_{\alpha})}^* = \sup_{x \in \mathcal{B}_{\alpha}} (\|I - D_{1/a}A\| x) = \|I - D_{1/a}A\|_{S_{\alpha}} < 1$$ 

and we conclude by Proposition 8. c) Here we have

$$\|I - D_{1/a}A\|_{\mathcal{B}(s^{(c)}_{\alpha})}^* = \|I - D_{1/a}A\|_{S_{\alpha}} < 1.$$ 

Then $(D_{1/a}A)^{-1} \in S_{\alpha} \cap \mathcal{B}(s^{(c)}_{\alpha})$, so $(D_{1/a}A)^{-1}$ is an operator represented by an infinite matrix, since $(D_{1/a}A)^{-1} \in S_{\alpha}$ and the condition $(D_{1/a}A)^{-1} \in \mathcal{B}(s^{(c)}_{\alpha})$ implies $(D_{1/a}A)^{-1} \in (s^{(c)}_{\alpha}, s^{(c)}_{\alpha})$. We conclude again by Proposition 8.

ii) a) By Proposition 7 ii) b) the condition $A^{\prime}D_{1/a} \in \Gamma_{1/\alpha}$ implies

$$\|I - D_{1/a}A\|_{\mathcal{B}(l_1(\alpha))}^* = \|I - (D_{1/a}A)^{\prime}\|_{S_{1/a}} < 1$$ 

and $(D_{1/a}A)^{-1} \in \mathcal{B}(l_1(\alpha)) = (l_1(\alpha), l_1(\alpha))$. Thus $A^{-1} \in (l_1(|a|_{\alpha}), l_1(\alpha))$ and we conclude by Proposition 8. ii) b) By Proposition 7 iii) we have $(D_{1/a}A)^{-1} \in \mathcal{B}(l_p (\alpha)) = (l_p (\alpha), l_p (\alpha))$, so $A^{-1} \in (l_p (|a|_{\alpha}), l_p (\alpha))$ and again we conclude by Proposition 8.

4. Matrix transformations mapping in the set $\chi(\Delta^k)$ for $k \geq 1$ integer and $\chi \in \{s_{\alpha}, s_{\alpha}^{(c)}, l_p (\alpha)\}$ with $1 \leq p < \infty$.

In this section we will give some properties of the set $\chi(\Delta)$ for $\chi = s_{\alpha}, s_{\alpha}^{(c)}$, $s_{\alpha}^{(c)}$, or $l_p (\alpha)$. The characterization of the set $(\chi(\Delta^k), \chi(\Delta^k))$ given in [15] being complicated, we will deal with the subset $(\chi(\Delta^k), \chi(\Delta^k), l_p (\Delta^k))$ of infinite Toeplitz triangles that map $\chi(\Delta^k)$ into itself.
4.1. The sets \( X = \chi(\Delta^k) \) for \( \chi = s_\alpha, s'_\alpha, s_\alpha^{(c)}, \) or \( l_p(\alpha), \) with \( 1 \leq p < \infty \)

Recall that the operator of first difference \([1, 3, 6, 7, 8], [10–13] \) and \([14–18],\) is defined by \( \Delta = (\eta_{nm})_{n,m \geq 1} \in \mathcal{L}, \) with \( \eta_{nm} = 1 \) for all \( n \geq 1, \) \( \eta_{n,n-1} = -1 \) for all \( n \geq 2 \) and \( \eta_{nm} = 0 \) otherwise. It is well known that \( \Sigma = \Delta^{-1} = (\eta_{nm})_{n,m \geq 1}, \) with \( \eta_{nm} = 1 \) for \( m \leq n \) and \( \eta_{nm} = 0 \) otherwise. We need to use the following sets

\[
\hat{C}_1 = \{ \alpha \in U^+ : (\alpha_1 + \cdots + \alpha_n)/\alpha_n = O(1) \ (n \to \infty) \},
\]

\[
\hat{C} = \{ \alpha \in U^+ : \lim_{n \to \infty} (\alpha_1 + \cdots + \alpha_n)/\alpha_n = l \ \text{for some} \ l \in \mathbb{C} \},
\]

\[
\Gamma = \{ \alpha \in U^+ : \lim_{n \to \infty} \left( \frac{\alpha_{n-1}}{\alpha_n} \right) < 1 \},
\]

\[
\hat{\Gamma} = \{ \alpha \in U^+ : \lim_{n \to \infty} \left( \frac{\alpha_{n-1}}{\alpha_n} \right) < 1 \}.
\]

It can be easily seen that \( \hat{\Gamma} \subset \Gamma \) and it was shown in \([12, \Gamma \subset \hat{C}_1 \) and by \([15] \) we have \( \hat{C} = \hat{\Gamma}. \) So we have

**Lemma 10.** \( \hat{C} = \hat{\Gamma} \subset \Gamma \subset \hat{C}_1. \)

We also have

**Lemma 11.** Let \( \alpha \in U^+ \) and \( k \geq 1 \) be an integer. Then

i) \( s_\alpha^{(c)}(\Delta^k) = s_\alpha^{(c)} \) if and only if \( \alpha \in \hat{\Gamma}. \)

ii) If \( \alpha \in \Gamma, \) then \( s_\alpha(\Delta^k) = s_\alpha, s'_\alpha(\Delta^k) = s'_\alpha \) and \( l_p(\alpha)(\Delta^k) = l_p(\alpha) \) for \( 1 \leq p < \infty. \)

**Proof.** i) comes from \([12, \text{Theorem 2.6, p. 1789}]. \) ii) By \([12, \text{Proposition 2.1, p. 1786}], \) the condition \( \alpha \in \Gamma \) implies \( \alpha \in \hat{C}_1, \) so \( \Delta \) and \( \Delta^k \) are bijective from \( s_\alpha \) to itself and from \( s'_\alpha \) to itself then \( s_\alpha(\Delta^k) = s_\alpha \) and \( s'_\alpha(\Delta^k) = s'_\alpha. \) It remains to show that if \( \alpha \in \Gamma, \) then \( l_p(\alpha)(\Delta) = l_p(\alpha) \) for \( 1 \leq p < \infty. \) If we put \( l = \lim_{n \to \infty}(\alpha_{n-1}/\alpha_n) < 1, \) for given \( \varepsilon_0, \) such that \( 0 < \varepsilon_0 < 1 - l, \) there exists \( N_0 \) such that \( \sup_{n \geq N_0}(\alpha_{n-1}/\alpha_n) \leq l + \varepsilon_0 < 1. \) Consider now the infinite matrix

\[
\Sigma_\alpha^{(N_0)} = \begin{pmatrix}
[\Delta_\alpha^{(N_0)}]^{-1} & O \\
O & 1 \\
1 & 1
\end{pmatrix},
\]

\( \Delta_\alpha^{(N_0)} \) being the finite matrix whose entries are those of \( \Delta_\alpha = D_{1/\alpha} \Delta D_\alpha \) for all \( n, m \leq N_0. \) We get

\[
Q = \Sigma_\alpha^{(N_0)} \Delta_\alpha = (q_{nm})_{n,m \geq 1},
\]

with

\[
q_{nm} = \begin{cases}
1, & \text{for } m = n, \\
\frac{\alpha_n}{\alpha_{n+1}}, & \text{for } m = n - 1 \geq N_0, \\
0, & \text{otherwise}.
\end{cases}
\]
For every $x \in l_p$ we get $(I - Q)x = (0, \ldots, 0, (\alpha_{N_0}/\alpha_{N_0+1})x_{N_0}, \ldots, (\alpha_{n-1}/\alpha_n)x_{n-1}, \ldots)^t$, where $\alpha_{N_0}x_{N_0}/\alpha_{N_0+1}$ is in the $(N_0 + 1)$ position. So we get
$$\| (I - Q)x \|_{l_p}^p = \sum_{n=N_0+1}^{\infty} \left( \frac{\alpha_{n-1}}{\alpha_n} \right)^p |x_{n-1}|^p \leq \sup_{\alpha \geq N_0+1} \left( \frac{\alpha_{n-1}}{\alpha_n} \right) \left( \sum_{n=N_0}^{\infty} |x_n|^p \right),$$
and
$$\| I - Q \|_{\mathcal{B}(l_p)} = \sup_{x \neq 0} \left( \frac{\| (I - Q)x \|_{l_p}}{\| x \|_{l_p}} \right) \leq \left[ \sup_{\alpha \geq N_0+1} \left( \frac{\alpha_{n-1}}{\alpha_n} \right) \right]^{1/2}.$$ Since $\alpha_{n-1}/\alpha_n \leq l + \varepsilon_0 < 1$ for all $n \geq N_0 + 1$, we deduce
$$\sup_{n \geq N_0+1} \left( \frac{\alpha_{n-1}}{\alpha_n} \right)^p < 1.$$ Hence
$$\| I - Q \|_{\mathcal{B}(l_p)} \leq \left[ \sup_{n \geq N_0+1} \left( \frac{\alpha_{n-1}}{\alpha_n} \right) \right]^{1/2} < 1.$$ We have shown that $Q$ is invertible in $\mathcal{B}(l_p)$. Now let $b \in l_p$. The equations
$$\Delta_\alpha x = b \quad \text{and} \quad Qx = \Sigma^{(N_0)}b$$
are equivalent in $l_p$. Since $Q^{-1} \in \mathcal{B}(l_p)$, reasoning as in Proposition 8 that $Q^{-1}(Qx) = (Q^{-1}Q)x = x = (\Delta_\alpha)^{-1}b$ for all $x \in l_p$. This shows the map $\Delta_\alpha$ is bijective from $l_p$ to $l_p$ and $\Delta$ is bijective from $l_p(\alpha)$ to $l_p(\alpha)$. $\blacksquare$

4.2. The set $(\chi(\Delta), \chi(\Delta))$ for $\chi \in \{s_\alpha, s_\alpha^*, s_\alpha^{(c)}\}$

First recall the characterizations of the set $(\chi(\Delta), \chi(\Delta))$ for $\chi = s_\alpha$, $s_\alpha^*$, or $s_\alpha^{(c)}$. For this we will consider the following properties

\begin{align*}
\lim_{l \to \infty} \left( \sum_{j=1}^{l} \sum_{k=1}^{\infty} \left( \frac{a_{nk} - a_{n-1,k}}{\alpha_n} \right) \right) & = 0 \text{ for all } n; \quad (10) \\
\sup_{n \geq 1} \left( \sum_{j=1}^{\infty} \sum_{k=1}^{\infty} \left( \frac{a_{nk} - a_{n-1,k}}{\alpha_n} \right) \right) & < \infty; \quad (11) \\
\lim_{n \to \infty} \alpha_j \left( \sum_{k=1}^{\infty} \left( \frac{a_{nk} - a_{n-1,k}}{\alpha_n} \right) \right) & = 0 \text{ for all } j; \quad (12) \\
\sup_{l \geq 1} \left( \sum_{j=1}^{l} \alpha_j \left( \sum_{k=1}^{\infty} \left( \frac{a_{nk} - a_{n-1,k}}{\alpha_n} \right) \right) \right) & < \infty \text{ for all } n; \quad (13) \\
\lim_{n \to \infty} \alpha_j \left( \sum_{k=1}^{\infty} \left( \frac{a_{nk} - a_{n-1,k}}{\alpha_n} \right) \right) & = l_j \text{ for all } j; \quad (14) \\
\lim_{n \to \infty} \left( \sum_{k=1}^{\infty} \left( \frac{a_{nk} - a_{n-1,k}}{\alpha_n} \right) \right) & \exists \alpha_j \quad (15)
\end{align*}

The following Proposition was proved in [15]
PROPOSITION 12. Let $\alpha \in U^+$. Then
i) $A \in (s_\alpha(\Delta), s_\alpha(\Delta))$ if and only if (10) and (11) hold;
ii) $A \in (s_\alpha^\circ(\Delta), s_\alpha(\Delta))$ if and only if (11), (12) and (13) hold;
iii) $A \in (s_\alpha^c(\Delta), s_\alpha^c(\Delta))$ if and only if (11), (13), (14) and (15) hold.

Note that $A \in \chi(\Delta^k), \chi(\Delta^k))$ if and only if

$$D_{1/\alpha}\Delta^k A \in (\chi(\Delta^k), Y) \text{ with } Y \in \{l_\infty, c_0, c\},$$

see [16]. Now we will give necessary conditions for a matrix map to be bijective from $\chi(\Delta^k)$ into itself when $\chi \in \{s_\alpha, s_\alpha^\circ, s_\alpha^c, l_p(\alpha)\}$ and $p \geq 1$ real. We have

PROPOSITION 13. Let $\alpha \in U^+$ and $k \geq 1$ an integer.

i) Let $b \in \chi(\Delta^k), \chi \in \{s_\alpha, s_\alpha^\circ, s_\alpha^c\}$ and assume that there is $\tau \in [0, 1[$ such that

$$\|\Delta^k[I - A]x\|_{s_\alpha} \leq \tau \|\Delta^k x\|_{s_\alpha} \text{ for all } x \in \chi(\Delta^k).$$

Then

a) the map $A : x \mapsto Ax$ is bijective from $\chi(\Delta^k)$ into itself;
b) if (16) holds and $\alpha \in \hat{\Gamma}$ then the matrix map $A : x \mapsto Ax$ is bijective from $\chi$ into itself.

ii) a) If $\alpha \in \Gamma$ and $A' \in \Gamma_{1/\alpha}$, then $A : x \mapsto Ax$ is bijective from $l_1(\alpha)(\Delta^k)$ into itself.
b) Let $1 < p < \infty$. If $\alpha \in \Gamma$ and $A \in \Gamma_{p, \alpha}$, then the map $A : x \mapsto Ax$ is bijective from $l_p(\alpha)(\Delta^k)$ into itself.

Proof. i) a) It is enough to show the proposition in the case when $X = s_\alpha$.

Using Lemma 3, condition (16) means that

$$\|I - A\|_{B(s_\alpha(\Delta^k))} = \sup_{x \neq 0} \left( \frac{\|\Delta^k[I - A]x\|_{s_\alpha}}{\|\Delta^k x\|_{s_\alpha}} \right) \leq \tau < 1,$$

so $A$ is invertible in $B(s_\alpha(\Delta^k))$ and by Proposition 8 the equation $Ax = b$ for $b \in s_\alpha(\Delta^k)$ admits a unique solution in $s_\alpha(\Delta^k)$. i) b) Since $\hat{\Gamma} \subset \Gamma$, by Lemma 10 and Lemma 11 ii), we easily deduce that $\alpha \in \hat{\Gamma}$ implies $\chi(\Delta^k) = \chi, \|x\|_\chi = \|x\|_{s_\alpha}$ for $\chi \in \{s_\alpha, s_\alpha^\circ, s_\alpha^c\}$. We conclude since condition (16) means that

$$\|I - A\|_{B(s_\alpha)} = \|I - A\|_{s_\alpha} \leq \tau < 1.$$ 

ii) By Lemma 11, the condition $\alpha \in \Gamma$ implies $\Delta$ is bijective from $l_p(\alpha)$ to itself for any given $p$ with $1 \leq p < \infty$. Then $\Delta^k$ is also bijective and $l_p(\alpha)(\Delta^k) = l_p(\alpha)$.

We conclude applying Corollary 9 ii) with $a = c$. $\blacksquare$

EXAMPLE 14. Let $\gamma, \eta \in \mathbb{C}$ and put

$$M(\gamma, \eta) = \begin{pmatrix}
1 & \eta & 0 \\
\gamma & 1 & \eta \\
0 & \cdots & .
\end{pmatrix}.$$  

(17)
As a direct consequence of Proposition 13 we can state the following. For \( \alpha \in U^+ \) and
\[
\xi_\alpha = |\gamma| \sup_{n \geq 2} \left( \frac{\alpha_{n-1}}{\alpha_n} \right) + |\eta| \sup_{n \geq 1} \left( \frac{\alpha_{n+1}}{\alpha_n} \right) < 1,
\]
the equation \( M(\gamma, \eta)x = b \) with \( b \in s_\alpha(\Delta) \) admits a unique solution \( x^* = [M(\gamma, \eta)]^{-1}b \in s_\alpha(\Delta) \). Furthermore if \( \alpha \in \Gamma \) the equation \( M(\gamma, \eta)x = b \) with \( b \in s_\alpha \) admits a unique solution \( x^* \in s_\alpha \).

**Proof.** First we have \([M(\gamma, \eta) - I]x = (\gamma x_n + \eta x_{n+1})_{n \geq 1}, \) with \( x_0 = 0 \). Then we easily get \( \Delta[(M(\gamma, \eta) - I)x] = (y_n)_{n \geq 1} \) with
\[
y_n = \eta(x_{n+1} - x_n) + \gamma(x_{n-1} - x_{n-2}) = 0 \text{ and } x_{-1} = x_0 = 0.
\]
Hence
\[
\frac{1}{\alpha_n} |y_n| \leq |\eta||x_{n+1} - x_n| + |\gamma||x_{n-1} - x_{n-2}||1 - \frac{\alpha_{n+1}}{\alpha_n} \alpha_{n-1} \alpha_n|
\leq |\eta| \frac{\alpha_{n+1}}{\alpha_n} \|\Delta x\|_{s_\alpha} + |\gamma| \frac{\alpha_{n-1}}{\alpha_n} \|\Delta x\|_{s_\alpha}.
\]
Thus
\[
\sup_{n \geq 1} \left( \frac{1}{\alpha_n} |y_n| \right) = \|\Delta[(I - M(\gamma, \eta))x]\|_{s_\alpha} \leq \xi_\alpha \|\Delta x\|_{s_\alpha} < \|\Delta x\|_{s_\alpha}
\]
and
\[
\|I - M(\gamma, \eta)\|_{\mathcal{B}(s_\alpha(\Delta))}^* < 1.
\]
As above we conclude that if (18) holds the equation \( M(\gamma, \eta)x = b \) with \( b \in s_\alpha(\Delta) \) admits in \( s_\alpha(\Delta) \) the unique solution \( x^* = [M(\gamma, \eta)]^{-1}b \). If \( \alpha \in \Gamma \), then \( s_\alpha(\Delta) = s_\alpha \) by Lemma 11 and we conclude from the preceding that the equation \( M(\gamma, \eta)x = b \) with \( b \in s_\alpha \) admits a unique solution in \( s_\alpha \).

**4.3. The equation \( T_\alpha x = b \), where \( T_\alpha \) is a Toeplitz triangle matrix**

We will denote by \( \mathcal{L}' \subset \mathcal{L} \) the set of all infinite Toeplitz triangles. We will say that \( T = (t_{nm})_{n,m \geq 1} \in \mathcal{L}' \) if there is a sequence \( a = (a_n)_{n \geq 1} \in s \), such that \( t_{nm} = a_{n-m+1} \) for \( m \leq n \) and \( t_{nm} = 0 \) otherwise; then we will write \( T = T_\alpha \); \( \mathcal{L}' \) is a subset of the set of Toeplitz matrices, see [1]. It can easily be seen that \( T_\alpha T_{\alpha'} = T_\alpha T_{\alpha} \) for all \( \alpha, \alpha' \in s \). We then have the next result.

**Proposition 15.** Let \( k \geq 1 \) be an integer and let \( T_\alpha \in \mathcal{L}' \) for \( \alpha \in U \). Then
i) \( T_\alpha \in \mathcal{B}(s_\alpha(\Delta^k)) \) if and only if \( T_\alpha \in S_\alpha \);
ii) \( T_\alpha \in \mathcal{B}(s_\alpha^{(c)}(\Delta^k)) \) if and only if \( T_\alpha \in S_\alpha \) and
\[
\lim_{n \to \infty} \frac{a_{n-m+1}}{\alpha_n} = 0 \text{ for all } m;
\]
iii) \( T_\alpha \in \mathcal{B}(s_\alpha^{(c)}(\Delta^k)) \) if and only if \( T_\alpha \in S_\alpha \),
\[
\lim_{n \to \infty} \frac{a_{n-m+1}}{\alpha_n} = l_m \text{ for all } m
\]
and
\[
\lim_{n \to \infty} \left( \sum_{m=1}^{n} a_{n-m+1} \frac{a_m}{a_n} \right) = l. \tag{21}
\]

iv) \(\| T_a \|_{B(s_\alpha(\Delta^k))} \leq \| T_a \|_{B(s_\alpha(\Delta^k))} \leq \| T_a \|_{s_\alpha} \) for \( \alpha \in \Gamma \).

v) Let \( 1 \leq p < \infty \). Then \( T_a \in B(l_p(\alpha)(\Delta^k)) \) if and only if \( T_a \in (l_p(\alpha), l_p(\alpha)) \).

Proof. i) The set \( s_\alpha(\Delta^k) \) is a BK space by Lemma 3 in which \( T = \Delta^k \). So by Remark 1, \( T_a \in B(s_\alpha(\Delta^k)) \) if and only if \( T_a \in (s_\alpha(\Delta^k), s_\alpha(\Delta^k)) \). Thus the condition \( T_a \in B(s_\alpha(\Delta^k)) \) is equivalent to \( T_a(\Sigma^k x) \in s_\alpha(\Delta^k) \) for all \( x \in s_\alpha \). So \( T_a \in B(s_\alpha(\Delta^k)) \) if and only if
\[
\Delta^k[T_a(\Sigma^k x)] \in s_\alpha \quad \text{for all } x \in s_\alpha.
\]
Since \( \Delta^k, \Sigma^k \in \mathcal{L}' \), we have
\[
\Delta^k[T_a(\Sigma^k x)] = (\Delta^kT_a)\Sigma^k x = (T_a(\Delta^k))x = T_a x \quad \text{for all } x \in s_\alpha.
\]
We conclude that \( T_a \in B(s_\alpha(\Delta^k)) \) if and only if \( T_a \in (s_\alpha, s_\alpha) \), that is \( T_a \in S_\alpha \). ii) As above \( s_\alpha(\Delta^k) \) is a BK space and \( T_a \in B(s_\alpha(\Delta^k)) \) if and only if \( T_a \in (s_\alpha, s_\alpha) \). Now we have \( D_{1/\alpha}T_aD_\alpha = (\xi_{nm})_{n,m \geq 1} \), with \( \xi_{nm} = a_{n-m+1}a_m/a_n \) for \( m \leq n \) and \( \xi_{nm} = 0 \) otherwise. Thus we get \( D_{1/\alpha}T_aD_\alpha = (c_0, c_0) \) if and only if \( T_a \in S_\alpha \) and (19) holds. We get iii) by a similar argument. So \( T_a \in B(s_\alpha(\Delta^k)) \) if and only if \( T_a \in (s_\alpha, s_\alpha) \) and \( T_a \in B(s_\alpha(\Delta^k)) \) if and only if \( T_a \in (s_\alpha, s_\alpha) \).

iv) Let us show that \( \| T_a \|_{B(s_\alpha(\Delta^k))} \leq \| T_a \|_{s_\alpha} \). We have
\[
\| T_a \|_{B(s_\alpha(\Delta^k))} = \sup_{x \neq 0} \left( \frac{\| T_a x \|_{s_\alpha(\Delta^k)}}{\| x \|_{s_\alpha(\Delta^k)}} \right) < \infty.
\]
Since \( \Delta^k \in \mathcal{L}' \), we have \( \Delta^k T_a = T_a \Delta^k \) and for every \( x \in s_\alpha(\Delta^k) \)
\[
\| T_a x \|_{s_\alpha(\Delta^k)} = \| \Delta^k(T_a x) \|_{s_\alpha} = \| T_a(\Delta^k x) \|_{s_\alpha},
\]
so
\[
\| T_a x \|_{s_\alpha(\Delta^k)} \leq \| T_a \|_{S_\alpha} \| \Delta^k x \|_{s_\alpha} = \| T_a \|_{S_\alpha} \| x \|_{s_\alpha(\Delta^k)}
\]
and
\[
\| T_a \|_{B(s_\alpha(\Delta^k))} \leq \| T_a \|_{s_\alpha}.
\]
Now it can easily be seen that \( \| T_a \|_{B(s_\alpha(\Delta^k))} = \| T_a \|_{B(s_\alpha(\Delta^k))} \). In the case when \( \alpha \in \Gamma \) we have \( s_\alpha(\Delta^k) = s_\alpha \) and by Proposition 7 i) we get
\[
\| T_a \|_{B(s_\alpha(\Delta^k))} = \| T_a \|_{S_\alpha}.
\]

v) By Lemma 3 where \( T = \Delta^k \), we see that \( l_p(\alpha)(\Delta^k) \) is a BK space. We have \( T_a \in B(l_p(\alpha)(\Delta^k)) \) if and only if \( T_a \in (l_p(\alpha)(\Delta^k), l_p(\alpha)(\Delta^k)) \). Now \( T_a \in (l_p(\alpha)(\Delta^k), l_p(\alpha)(\Delta^k)) \) if and only if \( \Delta^k(T_a \Sigma^k x) = T_a x \in l_p(\alpha) \) for all \( x \in l_p(\alpha) \). This means that \( T_a \in (l_p(\alpha), l_p(\alpha)) \). \( \blacksquare \)
PROPOSITION 16. Let $T_a \in \mathcal{L}'$ with $a_1 \neq 0$. Then

i) If $(1/a_1)T_a \in \Gamma_\alpha$ then for any given $b \in s_\alpha(\Delta^k)$ the equation $T_ax = b$ admits in $s_\alpha(\Delta^k)$ a unique solution

$$x = T_a^{-1}b.$$  \hfill (22)

ii) If $(1/a_1)T_a \in \Gamma_\alpha$ and (19) holds, then for any given $b \in s_\alpha^c(\Delta^k)$ the equation $T_ax = b$ admits in $s_\alpha^c(\Delta^k)$ a unique solution given by (22).

iii) If $(1/a_1)T_a \in \Gamma_\alpha$, (20) and (21) hold, then for any given $b \in s_\alpha^{-1}(\Delta^k)$ the equation $T_ax = b$ admits in $s_\alpha^{-1}(\Delta^k)$ a unique solution given by (22).

iv) a) If $(1/a_1)T_a^* \in \Gamma_1/\alpha$, then for any given $b \in l_1(\alpha)(\Delta^k)$ the equation $T_ax = b$ admits in $l_1(\alpha)(\Delta^k)$ a unique solution given by (22).

b) Let $1 < p < \infty$ and assume that $(1/a_1)T_a \in \Gamma_{p,\alpha}$. Then for any given $b \in l_p(\alpha)(\Delta^k)$ the equation $T_ax = b$ admits in $l_p(\alpha)(\Delta^k)$ a unique solution given by (22).

Proof. i) Since $T_a \in \mathcal{L}$ the equation $T_ax = b$ is equivalent to $x = T_a^{-1}b$. Now the condition $(1/a_1)T_a \in \Gamma_\alpha$ implies $T_a^{-1} \in S_\alpha$ and by Proposition 15 i), this means that $T_a^{-1} \in \mathcal{B}(s_\alpha(\Delta^k))$. We conclude $T_a^{-1}b \in s_\alpha(\Delta^k)$.

ii) By Proposition 15 ii) we have $T_a \in \mathcal{B}(s_\alpha(\Delta^k))$ since $T_a \in (s_\alpha,s_\alpha)$; and the condition $(1/a_1)T_a \in \Gamma_\alpha$ and Proposition 15 iv) imply

$$\left\| I - \frac{1}{t_{11}}T_a \right\|_{\mathcal{B}(s_\alpha(\Delta^k))}^* = \left\| I - \frac{1}{t_{11}}T_a \right\|_{\mathcal{B}(s_\alpha(\Delta^k))}^* \leq \left\| I - \frac{1}{t_{11}}T_a \right\|_{S_\alpha} < 1.$$

Then $T_a^{-1} \in \mathcal{B}(s_\alpha(\Delta^k))$ and the unique solution of the equation $T_ax = b$ for $b \in s_\alpha(\Delta^k)$ is $x = T_a^{-1}b \in s_\alpha(\Delta^k)$. We get iii) from the characterization of $(s_\alpha^c,s_\alpha^{-1}c)$ and reasoning as above. iv) a) is a direct consequence of Corollary 9 ii) a) and Proposition 15 v). iv) b) Here the condition $(1/a_1)T_a \in \Gamma_{p,\alpha}$ implies $T_a^{-1} \in (l_p(\alpha),l_p(\alpha))$, since $\mathcal{B}(l_p(\alpha)) = (l_p(\alpha),l_p(\alpha))$. Then from Proposition 15 v) $T_a^{-1} \in (l_p(\alpha)(\Delta^k),l_p(\alpha)(\Delta^k))$ and for all $b \in l_p(\alpha)(\Delta^k)$ the unique solution $x = T_a^{-1}b$ of the equation $T_ax = b$ belongs to $l_p(\alpha)(\Delta^k)$. \hfill $\blacksquare$

REMARK 2. The conditions $(1/a_1)T_a \in \Gamma_\alpha$ and $(1/a_1)T_a^* \in \Gamma_1/\alpha$ are equivalent to

$$\sup_{n \geq 2} \left( \frac{n-1}{n} \left| \frac{a_{n-m+1}}{\alpha_m} \right| \right) < |a_1| \quad \text{and} \quad \sup_{n \geq 1} \left( \sum_{m=n+1}^{\infty} \left| \frac{a_{n-m+1}}{\alpha_m} \right| \right) < |a_1|,$$

respectively. Note that the condition $(1/a_1)T_a \in \Gamma_{p,\alpha}$ means

$$\sum_{n=2}^{\infty} \left( \sum_{m=1}^{n-1} \left| a_{n-m+1} \right|^p \right)^{1/p} < |a_1|^{p/(p-1)}.$$  \hfill (23)

Furthermore, it can be verified from Proposition 15 that if $T_a \in \mathcal{L}'$, then

i) $T_a \in \mathcal{B}(c(\Delta^k))$ if and only if $T_a \in S_1$ and $a \in c_0$;

ii) $T_a \in \mathcal{B}(c(\Delta^k))$ if and only if $T_a \in S_1$ and $a \in c_\alpha$. 

5. Application to infinite tridiagonal matrices

In this section we will consider infinite tridiagonal matrices. These matrices are used in many applications, let us cite for instance the case of continued fractions [9], or the finite differences method, see [20]. We deal with some properties of the matrix map $M(\gamma, a, \eta)$ between particular sequence spaces. Then we will explicitly calculate the inverse of $M(\gamma, a, \eta)$.

5.1. Properties of infinite matrices considered as operators in certain BK spaces

Let $\gamma = (\gamma_n)_{n \geq 1}$, $\eta = (\eta_n)_{n \geq 1}$, $a' = (a_n)_{n \geq 1}$ be sequences with $a' \in U$. Consider the infinite tridiagonal matrix

$$M(\gamma, a, \eta) = \begin{pmatrix} a_1 & \eta_1 & 0 \\ \gamma_2 & a_2 & \eta_2 \\ 0 & \gamma_n & a_n & \eta_n \end{pmatrix}.$$ 

We then have

**Proposition 17.** Assume that $D_{1/a} M(\gamma, a, \eta) \in \Gamma_\alpha$, that is

$$\sup_{n \geq 1} \left[ \frac{1}{a_n} \left( \gamma_n - \alpha_{n-1} \alpha_n + \eta_n \alpha_{n+1} \right) \right] < 1.$$ 

Then

i) $M(\gamma, a, \eta)$ is bijective from $s_{|a|\alpha}$ into $s_{|a|\alpha}$ and $M(\gamma, a, \eta)^{-1} \in (s_{|a|\alpha}, s_{\alpha});$

ii) $M(\gamma, a, \eta)$ is bijective from $s_{\alpha}^\circ$ into $s_{\alpha}^\circ$ and $M(\gamma, a, \eta)^{-1} \in (s_{\alpha}^\circ, s_{\alpha}^\circ);$ 

iii) if

$$\lim_{n \to \infty} \left[ \frac{1}{a_n} \left( \gamma_n - \alpha_{n-1} \alpha_n + \eta_n \alpha_{n+1} \right) \right] = l \neq 0,$$

then $M(\gamma, a, \eta)$ is bijective from $s_{\alpha}^\circ$ into $s_{\alpha}^\circ$ and $M(\gamma, a, \eta)^{-1} \in (s_{\alpha}^\circ, s_{\alpha}^\circ).$

iv) Let $p \geq 1$ be a real. If $K_{p, \alpha} = K_1 + K_2 < 1$ with

$$K_1 = \sup_{n \geq 1} \left( \frac{\gamma_n}{a_n} \frac{\alpha_{n-1}}{\alpha_n} \right) \text{ and } K_2 = \sup_{n \geq 1} \left( \frac{\eta_n}{a_n} \frac{\alpha_{n+1}}{\alpha_n} \right),$$

then $M(\gamma, a, \eta)$ is bijective from $l_p(\alpha)$ into $l_p(\alpha)$ and $M(\gamma, a, \eta)^{-1} \in (l_p(\alpha), l_p(\alpha))$.

**Proof.** i), ii) and iii) are direct consequences of Corollary 9. iv) We get

$$\|(I - D_{1/a} M(\gamma, a, \eta))x\|_{l_p(\alpha)} = \left( \sum_{n=1}^{\infty} \left| \frac{1}{a_n} \left( \gamma_n x_{n-1} + \eta_n x_{n+1} \right) \right|^p \right)^{1/p} = \left( \sum_{n=1}^{\infty} \left| \frac{\gamma_n}{a_n} \frac{\alpha_{n-1}}{\alpha_n} x_{n-1} + \frac{\eta_n}{a_n} \frac{\alpha_{n+1}}{\alpha_n} x_{n+1} \right|^p \right)^{1/p} \leq \left( \sum_{n=1}^{\infty} \left( K_1 \left| \frac{x_{n-1}}{\alpha_{n-1}} \right| + K_2 \left| \frac{x_{n+1}}{\alpha_{n+1}} \right| \right) \right)^{1/p}.$$
Applying Minkowski’s inequality we get
\[
\left( \sum_{n=1}^{\infty} \left( K_1 \frac{|x_{n-1}|}{\alpha_{n-1}} + K_2 \frac{|x_{n+1}|}{\alpha_{n+1}} \right)^p \right)^{1/p} \leq K_1 \left( \sum_{n=1}^{\infty} \left( \frac{|x_{n-1}|}{\alpha_{n-1}} \right)^p \right)^{1/p} + K_2 \left( \sum_{n=1}^{\infty} \left( \frac{|x_{n+1}|}{\alpha_{n+1}} \right)^p \right)^{1/p}
\]
we conclude that
\[
\| I - D_{1/a} M(\gamma, a, \eta) \|_{\mathcal{B}(l_p(\alpha))}^* \leq (K_1 + K_2) < 1.
\]

So \( D_{1/a} M(\gamma, a, \eta) \) is invertible in \( \mathcal{B}(l_p(\alpha)) \) and \( A = D_{1/a}(D_{1/a} M(\gamma, a, \eta)) \) is bijective from \( l_p(\alpha) \) into \( l_p(|a|\alpha) \). Since \( \mathcal{B}(l_p(\alpha)) = (l_p(\alpha), l_p(\alpha)) \), we conclude
\[
[D_{1/a} M(\gamma, a, \eta)]^{-1} \in (l_p(\alpha), l_p(\alpha))
\]
and \( M(\gamma, a, \eta)^{-1} \in (l_p(|a|\alpha), l_p(\alpha)) \). ■

We deduce the next corollary.

**Corollary 18.** If \( \widetilde{K}_{1,\alpha} < 1 \), then \( M(\gamma, a, \eta) \) is bijective from \( l_1(\alpha) \) to \( l_1(|a|\alpha) \) and bijective from \( s_{\alpha} \) to \( s_{|a|\alpha} \).

**Proof.** First taking \( p = 1 \) in Proposition 17 iv), we deduce that \( A \) is bijective from \( l_1(\alpha) \) to \( l_1(|a|\alpha) \). Then from
\[
\| I - D_{1/a} M(\gamma, a, \eta) \|_{s_{\alpha}} = \widetilde{K}_{a}' \leq \widetilde{K}_{1,\alpha} < 1,
\]
we conclude that \( M(\gamma, a, \eta) \) is bijective from \( s_{\alpha} \) to \( s_{|a|\alpha} \). ■

**Remark 3.** Note that in the case when \( p = 1 \), the condition
\[
\| I - [D_{1/a} M(\gamma, a, \eta)]^\dagger \|_{s_{\alpha}} = \sup_{n \geq 1} \left( \frac{\gamma_{n+1}}{\alpha_{n+1}} \frac{\alpha_{n+1}}{\alpha_n} + \frac{\eta_{n-1}}{\alpha_{n-1}} \frac{\alpha_{n-1}}{\alpha_n} \right) < 1,
\]
also implies \( M(\gamma, a, \eta) \) is bijective from \( l_1(\alpha) \) to \( l_1(|a|\alpha) \).

### 5.2. The Inverse of an Infinite Tridiagonal Matrix.

In this subsection, among other things, we are interested in the calculation of the inverse of \( M(\gamma, \eta) \) defined in Example 14.

For this we need to recall the next results. We can associate with any power series \( f(z) = \sum_{k=0}^{\infty} a_k z^k \) defined in the open disk \( |z| < R \) the upper triangular infinite matrix \( A = \varphi(f) \in \bigcup_{0 < r < R} S_r \) defined by
\[
\varphi(f) = \begin{pmatrix}
\alpha_0 & a_1 & a_2 & \\
a_0 & \alpha_1 & a_2 & \\
a_0 & a_1 & \alpha_2 & \\
a_0 & a_1 & a_2 & \ddots
\end{pmatrix},
\]
(see [6]). Practically we shall write \( \varphi[f(z)] \) instead of \( \varphi(f) \). We have

**Lemma 19.** i) The map \( \varphi \colon f \mapsto A \) is an isomorphism from the algebra of the power series defined in \( |z| < R \), into the algebra of the corresponding matrices \( A \).
ii) Let \( f(z) = \sum_{k=0}^{\infty} a_k z^k \), with \( a_0 \neq 0 \), and assume that \( 1/f(z) = \sum_{k=0}^{\infty} a'_k z^k \) admits \( R' > 0 \) as radius of convergence. We then have

\[
\phi \left( \frac{1}{f} \right) = [\phi(f)]^{-1} \in \bigcup_{0 < r < R'} S_r.
\]

From the previous results we get

**Proposition 20.** Let \( \gamma, \eta \) be reals with \( 0 < \gamma + \eta < 1 \). Then

i) \( M(\gamma, \eta) : x \mapsto M(\gamma, \eta)x \) is bijective from \( \chi \) into itself, for \( \chi \in \{ s_1, c_0, c \} \).

ii) a) Let \( \chi \) be either one of the sets \( s_1 \), or \( c_0 \), or \( c \) and put

\[
u = \frac{1 - \sqrt{1 - 4\gamma \eta}}{2\gamma} \quad \text{and} \quad v = \frac{1 - \sqrt{1 - 4\gamma \eta}}{2\eta}.
\]

Then for any given \( b \in \chi \) the equation \( M(\gamma, \eta)x = b \) admits a unique solution \( x = (x_n)_{n \geq 1} \) in \( \chi \) given by

\[
x_n = \left( \frac{uv + 1}{uv - 1} \right) (-1)^n v^n \sum_{m=1}^{\infty} [1 - (uv)^{-l}](-1)^m u^m b_m \quad \text{for all } n. \tag{23}
\]

with \( l = \min(n, m) \).

b) The inverse \( [M(\gamma, \eta)]^{-1} = (a'_{nm})_{n,m \geq 1} \) is given by

\[
a'_{nm} = \left( \frac{uv + 1}{uv - 1} \right) (-1)^{n+m} v^{n-m} [(uv)^l - 1] \quad \text{for all } n, m \geq 1 \text{ and } l = \min(n, m). \tag{24}
\]

**Proof.** i) We have \( \|I - M(\gamma, \eta)\|_{S_1} = \gamma + \eta < 1 \), so \( M(\gamma, \eta) \in \Gamma_1 \) and we conclude by Corollary 9 i) a) in which \( \alpha = e \). ii) Let \( u, v \) be reals with \( 0 < u < 1 \), \( 0 < v < 1 \) and consider the matrices

\[
\Delta_u^+ = \begin{pmatrix}
1 & u & \ldots & O \\
o & 1 & u & \ldots \\
& o & 1 & u \\
& & o & 1 \\
& & & o \\
& & & & 1 \\
& & & & & \ldots
\end{pmatrix} \quad \text{and} \quad \Delta_v = \begin{pmatrix}
1 & v & \ldots & O \\
o & 1 & v & \ldots \\
& o & 1 & v \\
& & o & 1 \\
& & & o \\
& & & & 1 \\
& & & & & \ldots
\end{pmatrix}.
\]

By a short calculation we get

\[
\frac{1}{1 + uv} \Delta_u^+ \Delta_v = \begin{pmatrix}
1 & \frac{u}{1+uv} & \frac{u}{1+uv} & O \\
\frac{v}{1+uv} & 1 & \frac{v}{1+uv} & O \\
\frac{v}{1+uv} & \frac{v}{1+uv} & 1 & O \\
& & & \vdots
\end{pmatrix}.
\]

Thus the identity \( M(\gamma, \eta) = \frac{1}{1 + uv} \Delta_u^+ \Delta_v \) is equivalent to \( \eta = u/(1 + uv) \) and \( \gamma = v/(1 + uv) \). Putting \( \xi = 1 + uv \), we get \( \eta = u/\xi \) and \( \gamma = v/\xi \), so \( \xi = 1 + \gamma \eta \xi^2 \). Since \( 0 < \gamma + \eta < 1 \), we have \( 4\gamma \eta < 1 \) and \( \zeta = (1 \pm \sqrt{1 - 4\gamma \eta})/2\gamma \) and the
condition $|u|, |v| < 1$ implies $u = (1 - \sqrt{1 - 4\gamma \eta})/2\gamma$ and $v = (1 - \sqrt{1 - 4\gamma \eta})/2\eta$. Then
\[
\left\| I - \frac{1}{1 + uv} \Delta_u^+ \Delta_v \right\|_{S_1} = \gamma + \eta = \frac{u + v}{1 + uv} < 1.
\]
Furthermore we have $\|I - \Delta_u^+\|_{S_1} = u < 1$ and $\|I - \Delta_v\|_{S_1} = v < 1$. So $\Delta_u^+$ and $\Delta_v$ are invertible in $S_1$ and by Lemma 19, we have
\[
(\Delta_u^+)^{-1} = \varphi(1/(1 + uz)) = \varphi\left(\sum_{k=0}^{\infty} (-1)^k u^k z^k\right),
\]
\[
(\Delta_v)^{-1} = \left[\varphi\left(\sum_{k=0}^{\infty} (-1)^k v^k z^k\right)\right]^t,
\]
with $|uz|, |vz| < 1$. This means that
\[
(\Delta_u^+)^{-1} = \Sigma_u^+ = \begin{pmatrix} 1 & -u & u^2 \\ 0 & 1 & -u \\ & & \ddots \end{pmatrix} \quad \text{and} \quad (\Delta_v)^{-1} = \Sigma_v = \begin{pmatrix} 1 & u & \vdots \\ v & 1 & \vdots \\ & & \ddots \end{pmatrix}.
\]

Then $(\frac{1}{1 + uv} \Delta_u^+ \Delta_v)^{-1} = (1 + uv) \Sigma_v \Sigma_u^+$. For any given $b \in S_1$, we successively get
\[
\Sigma_u^+ b = \left(\sum_{k=0}^{\infty} (-1)^k u^k b_{n+k}\right)_{n \geq 1},
\]
\[
\Sigma_v (\Sigma_u^+ b) = \left(\sum_{k=0}^{\infty} (-1)^{n-s} u^{n-s} \left(\sum_{k=0}^{\infty} (-1)^k u^k b_{s+k}\right)\right)_{n \geq 1}
\]
and the unique solution is given by
\[
x_n^o = (1 + uv) \sum_{s=1}^{n} \sum_{k=0}^{\infty} (-1)^{n-s+k} u^n s_{-u}^{k+s} b_{s+k}.
\]

Hence writing
\[
x_n^o = (1 + uv)(-v)^n \sigma_n \quad \text{with} \quad \sigma_n = \sum_{s=1}^{n} (uv)^{-s} \sum_{k=0}^{\infty} (-u)^{k+s} b_{s+k},
\]
putting $l = \min(n, m)$, we get
\[
\sigma_n = \sum_{s=1}^{n} (uv)^{-s} \sum_{m=0}^{\infty} (-u)^m b_m
\]
\[
= \sum_{m=1}^{n} (uv)^{-m} \sum_{s=1}^{m} (-u)^m b_m + \sum_{s=1}^{\infty} (uv)^{-s} \sum_{m=n+1}^{\infty} (-u)^m b_m
\]
\[
= \sum_{m=1}^{\infty} (-u)^m b_m \sum_{s=1}^{m} (uv)^{-s} + \sum_{m=n+1}^{\infty} (-u)^m b_m \sum_{s=1}^{\infty} (uv)^{-s}
\]
\[
= \sum_{m=1}^{\infty} (-u)^m b_m \sum_{s=1}^{m} (uv)^{-s} = \sum_{m=1}^{\infty} (-u)^m b_m \frac{(uv)^{-1} - (uv)^{-l-1}}{1 - (uv)^{-1}}
\]
\[
= \frac{1}{uv - 1} \sum_{m=1}^{\infty} (-u)^m b_m (1 - (uv)^{-l}),
\]
The Banach algebra $B(X)$ and applications

that is (23) and ii) a) holds. ii) b) is a direct consequence of the identity $x_n^* = \sum_{m=1}^{\infty} a'_{nm} b_m$ for all $n$, where $M^{-1} = (a'_{nm})_{n,m \geq 1}$. ■

ACKNOWLEDGEMENTS. The author thanks the referee for his contribution to improve some results and the presentation of the paper.
