2E2 Tutorial Sheet 14 Second Term¹

10 February 2004

Consider the non-linear differential equation

$$y'' = y - y^2 \tag{1}$$

- 1. (1) By defining $y_1 = y$ and $y_2 = y'_1$ convert this into two first order equations.
- 2. (1) The stationary points are the points where $y'_1 = y'_2 = 0$, find the two stationary points for this equation.
- 3. (2) Consider the $y_1 = 0$ stationary point, linearize the equations near this point by assuming $y_1 \ll 1$. Solve the corresponding linear equations. What sort of stationary point is this?
- 4. (2) Consider the $y_1 = 1$ stationary point, linearize the equations near this point by assuming $y_1 = 1 + \eta$ where $\eta \ll 1$. Solve the corresponding linear equations. What sort of stationary point is this?
- 5. (2) Try and draw the whole phase diagram, first draw in the two stationary points and then try and join the lines, remember the lines don't cross.
