## 2E2 Tutorial Sheet 11 Second Term, Solutions<sup>1</sup>

16 January 2004

1. (3) Find the general solutions for the system

$$\frac{dy_1}{dt} = -2y_1 + y_2 \tag{1}$$

$$\frac{dy_2}{dt} = y_1 - 2y_2 \tag{2}$$

Sketch the phase diagram and and describe the node.

Solution: This time the eigenvalues are -3 with eigenvector  $\begin{pmatrix} -1 \\ 1 \end{pmatrix}$  and -1 with eigenvector  $\begin{pmatrix} 1 \\ 1 \end{pmatrix}$ . Thus,

$$\mathbf{y} = c_1 \begin{pmatrix} -1 \\ 1 \end{pmatrix} e^{-3t} + c_2 \begin{pmatrix} 1 \\ 1 \end{pmatrix} e^{-t} \tag{3}$$

or

$$\begin{pmatrix} y_1 \\ y_2 \end{pmatrix} = \begin{pmatrix} -c_1 e^{-3t} + c_2 e^{-t} \\ c_1 e^{-3t} + c_2 e^{-t} \end{pmatrix}.$$
(4)

The phase diagram is

with all the arrows pointing inwards. The node is an improper node.

## 2. (3) Find the solution of

$$\frac{dy_1}{dt} = -9y_2 \tag{5}$$

$$\frac{dy_2}{dt} = y_1 \tag{6}$$

by considering  $y_1(0) = r$  and  $y_2(0) = 0$ , draw the phase diagram. Solution: Working out the eigenvalues

$$\begin{vmatrix} -\lambda & -9\\ 1 & -\lambda \end{vmatrix} = \lambda^2 + 9 = 0 \tag{7}$$

we find  $\lambda = \pm 3i$  and the 3i eigenvector is

$$\begin{pmatrix} 0 & -9 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} a \\ b \end{pmatrix} = 3i \begin{pmatrix} a \\ b \end{pmatrix}$$
(8)

so a = 3ib and the eigenvector is, for example,

$$\mathbf{x} = \begin{pmatrix} 3i\\1 \end{pmatrix} \tag{9}$$

The other eigenvector is the complex conjugate of this one and so the general solution is

$$\mathbf{y} = c_1 \begin{pmatrix} 3i \\ 1 \end{pmatrix} e^{3it} + c_2 \begin{pmatrix} -3i \\ 1 \end{pmatrix} e^{-3it}.$$
 (10)

Now, if we assume that  $y_1(0) = r$  and  $y_2(0) = 0$  we find  $c_1 = -c_2 = -ir/6$ . Putting this back in and using the sine and cosine formulas we get

$$\mathbf{y} = \begin{pmatrix} r\cos 3t\\ \frac{r}{3}\sin 3t \end{pmatrix} \tag{11}$$

so we have the eillipse

$$y_1^2 + (3y_2)^2 = r \tag{12}$$

with phase diagram

## 3. (3) Find the solution of

$$\frac{dy_1}{dt} = -y_1 - 2y_2 \tag{13}$$

$$\frac{dy_2}{dt} = 2y_1 - y_2 \tag{14}$$

for initial conditions  $y_1(0) = r$  and  $y_2(0) = 0$  write this in real form. Solution: This time the matrix is

$$A = \left(\begin{array}{rr} -1 & -2\\ 2 & -1 \end{array}\right)$$

and so the spectrum is complex,  $\lambda_1 = -1 + 2i$  with eigenvector

$$\mathbf{x}_1 = \left(\begin{array}{c}i\\1\end{array}\right)$$

and  $\lambda_2 = -1 - 2i$  with eigenvector

$$\mathbf{x}_2 = \left(\begin{array}{c} -i\\1\end{array}\right)$$

The solution is then

$$\mathbf{y} = \begin{pmatrix} y_1 \\ y_2 \end{pmatrix} = c_1 \begin{pmatrix} i \\ 1 \end{pmatrix} e^{(-1+2i)t} + c_2 \begin{pmatrix} -i \\ 1 \end{pmatrix} e^{(-1-2i)t}.$$

Now, this means

$$\begin{pmatrix} r\\0 \end{pmatrix} = \mathbf{y}(0) = c_1 \begin{pmatrix} i\\1 \end{pmatrix} + c_2 \begin{pmatrix} -i\\1 \end{pmatrix}.$$

and hence  $c_1 = -ir/2$  and  $c_2 = ir/2$ . Now using  $\exp(a + ib) = \exp a \exp ib$  we have solution

$$\mathbf{y} = \frac{r}{2} \left[ \left( \begin{array}{c} 1\\ -i \end{array} \right) e^{2it} + \left( \begin{array}{c} 1\\ i \end{array} \right) e^{-2it} \right] e^{-t}.$$

and so

$$\mathbf{y} = \frac{r}{2} \left[ \begin{pmatrix} 1 \\ -i \end{pmatrix} (\cos 2t + i \sin 2t) + \begin{pmatrix} 1 \\ i \end{pmatrix} (\cos 2t - i \sin 2t) \right] e^{-t}$$
$$= \begin{pmatrix} r \cos 2t \\ r \sin 2t \end{pmatrix} e^{-t}$$
