Let P(z) be a polynomial of degree at most n. We consider an operator B, which carries a polynomial P(z) into

$$B\left[P(z)\right] := \lambda_0 P(z) + \lambda_1 \left(\frac{nz}{2}\right) \frac{P'(z)}{1!} + \lambda_2 \left(\frac{nz}{2}\right)^2 \frac{P''(z)}{2!}$$

where λ_0 , λ_1 and λ_2 are such that all the zeros of

Polynomials, B operator, Inequalities in the complex domain.

$$u(z) = \lambda_0 + c(n,1)\lambda_1 z + c(n,2)\lambda_2 z^2$$

lie in the half plane

 $|z| \le \left|z - \frac{n}{2}\right|.$

In this paper, we estimate the minimum and maximum modulii of B[P(z)] on |z| = 1 with restrictions on the zeros of P(z) and thereby obtain compact generalizations of some well known polynomial inequalities.

Operator Preserving Inequalities

1. Introduction

Let P_n be the class of polynomials $P(z) = \sum_{j=0}^n a_j z^j$ of degree at most n then

(1.1)
$$\max_{|z|=1} |P'(z)| \le n \max_{|z|=1} |P(z)|$$

and

(1.2)
$$\max_{|z|=R>1} |P(z)| \le R^n \max_{|z|=1} |P(z)|$$

Inequality (1.1) is an immediate consequence of a famous result due to Bernstein on the derivative of a trigonometric polynomial (for reference see [6, 9, 14]). Inequality (1.2) is a simple deduction from the maximum modulus principle (see [15, p.346], [11, p. 158, Problem 269]).

Aziz and Dawood [3] proved that if P(z) has all its zeros in $|z| \leq 1$, then

(1.3)
$$\min_{|z|=1} |P'(z)| \ge n \min_{|z|=1} |P(z)|$$

and

(1.4)
$$\min_{|z|=R>1} |P(z)| \ge R^n \min_{|z|=1} |P(z)|.$$

Inequalities (1.1), (1.2), (1.3) and (1.4) are sharp and equality holds for a polynomial having all its zeros at the origin.

For the class of polynomials having no zeros in |z| < 1, inequalities (1.1) and (1.2) can be sharpened. In fact, if $P(z) \neq 0$ in |z| < 1, then

(1.5)
$$\max_{|z|=1} |P'(z)| \le \frac{n}{2} \max_{|z|=1} |P(z)|$$

and

(1.6)
$$\max_{|z|=R>1} |P(z)| \le \left(\frac{R^n + 1}{2}\right) \max_{|z|=1} |P(z)|.$$

Inequality (1.5) was conjectured by Erdös and later verified by Lax [7], whereas Ankeny and Rivlin [1] used (1.5) to prove (1.6). Inequalities (1.5) and (1.6) were further improved in [3], where under the same hypothesis, it was shown that

(1.7)
$$\max_{|z|=1} |P'(z)| \le \frac{n}{2} \left\{ \max_{|z|=1} |P(z)| - \min_{|z|=1} |P(z)| \right\}$$

and

(1.8)
$$\max_{|z|=R>1} |P(z)| \le \left(\frac{R^n+1}{2}\right) \max_{|z|=1} |P(z)| - \left(\frac{R^n-1}{2}\right) \min_{|z|=1} |P(z)|.$$

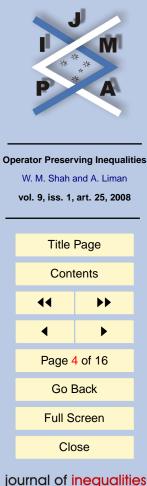

Equality in (1.5), (1.6), (1.7) and (1.8) holds for polynomials of the form $P(z) = \alpha z^n + \beta$, where $|\alpha| = |\beta|$.

Aziz [2], Aziz and Shah [5] and Shah [17] extended such well-known inequalities to the polar derivatives $D_{\alpha} P(z)$ of a polynomial P(z) with respect to a point α and obtained several sharp inequalities. Like polar derivatives there are many other operators which are just as interesting (for reference see [13, 14]). It is an interesting problem, as pointed out by Professor Q. I. Rahman to characterize all such operators. As an attempt to this characterization, we consider an operator B which carries $P \in P_n$ into

(1.9)
$$B[P(z)] := \lambda_0 P(z) + \lambda_1 \left(\frac{nz}{2}\right) \frac{P'(z)}{1!} + \lambda_2 \left(\frac{nz}{2}\right)^2 \frac{P''(z)}{2!},$$

where λ_0, λ_1 and λ_2 are such that all the zeros of

(1.10)
$$u(z) = \lambda_0 + c(n,1)\lambda_1 z + c(n,2)\lambda_2 z^2$$

in pure and applied mathematics

lie in the half plane

$$(1.11) |z| \le \left|z - \frac{n}{2}\right|,$$

and prove some results concerning the maximum and minimum modulii of B[P(z)]and thereby obtain compact generalizations of some well-known theorems.

We first prove the following theorem and obtain a compact generalization of inequalities (1.3) and (1.4).

Theorem 1.1. If $P \in P_n$ and $P(z) \neq 0$ in |z| > 1, then

(1.12)
$$|B[P(z)]| \ge |B[z^n]| \min_{|z|=1} |P(z)|, \text{ for } |z| \ge 1.$$

The result is sharp and equality holds for a polynomial having all its zeros at the origin.

Substituting for B[P(z)], we have for $|z| \ge 1$,

(1.13)
$$\left| \lambda_0 P(z) + \lambda_1 \left(\frac{nz}{2} \right) P'(z) + \lambda_2 \left(\frac{nz}{2} \right)^2 \frac{P''(z)}{2!} \right| \\ \geq \left| \lambda_0 z^n + \lambda_1 \left(\frac{nz}{2} \right) n z^{n-1} + \lambda_2 \left(\frac{nz}{2} \right)^2 \frac{n(n-1)}{2} z^{n-2} \right| \min_{|z|=1} |P(z)|,$$

where λ_0 , λ_1 and λ_2 are such that all the zeros of (1.10) lie in the half plane represented by (1.11).

Remark 1. If we choose $\lambda_0 = 0 = \lambda_2$ in (1.13), and note that in this case all the zeros of u(z) defined by (1.10) lie in (1.11), we get

$$|P'(z)| \ge n|z|^{n-1} \min_{|z|=1} |P(z)|, \text{ for } |z| \ge 1,$$

journal of inequalities in pure and applied mathematics

which in particular gives inequality (1.3).Next, choosing $\lambda_1 = 0 = \lambda_2$ in (1.13), which is possible in a similar way, we obtain

$$|P(z)| \ge |z|^n \min_{|z|=1} |P(z)|, \text{ for } |z| \ge 1.$$

Taking in particular $z = Re^{i\theta}, R \ge 1$, we get

$$\left|P(Re^{i\theta})\right| \ge R^n \min_{|z|=1} |P(z)|$$

which is equivalent to (1.4).

As an extension of Bernstein's inequality, it was observed by Rahman [12], that if $P \in P_n$, then

$$|P(z)| \le M, \quad |z| = 1$$

implies

(1.14)
$$|B[P(z)]| \le M |B[z^n]|, \quad |z| \ge 1.$$

As an improvement to this result of Rahman, we prove the following theorem for the class of polynomials not vanishing in the unit disk and obtain a compact generalization of (1.5) and (1.6).

Theorem 1.2. If $P \in P_n$, and $P(z) \neq 0$ in |z| < 1, then

(1.15)
$$|B[P(z)]| \le \frac{1}{2} \{ |B[z^n]| + |\lambda_0| \} \max_{|z|=1} |P(z)|, \text{ for } |z| \ge 1.$$

The result is sharp and equality holds for a polynomial whose zeros all lie on the unit disk.

Substituting for B[P(z)] in inequality (1.15), we have for $|z| \ge 1$,

(1.16)
$$\left| \lambda_0 P(z) + \lambda_1 \left(\frac{nz}{2} \right) P'(z) + \lambda_2 \left(\frac{nz}{2} \right)^2 \frac{P''(z)}{2} \right|$$

 $\leq \frac{1}{2} \left\{ \left| \lambda_0 z^n + \lambda_1 \left(\frac{nz}{2} \right) n z^{n-1} + \lambda_2 \left(\frac{nz}{2} \right)^2 \frac{n(n-1)}{2} z^{n-2} \right| + |\lambda_0| \right\} \max_{|z|=1} |P(z)|,$

where λ_0, λ_1 and λ_2 are such that all the zeros of (1.10) lie in the half plane represented by (1.11).

Remark 2. Choosing $\lambda_0 = 0 = \lambda_2$ in (1.16) which is possible, we get

$$|P'(z)| \le \frac{n}{2} |z|^{n-1} \max_{|z|=1} |P(z)|, \text{ for } |z| \ge 1$$

which in particular gives inequality (1.5).Next if we take $\lambda_1 = 0 = \lambda_2$ in (1.16) which is also possible, we obtain

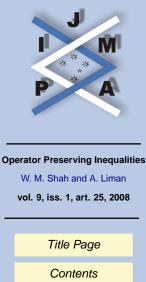

$$|P(z)| \le \frac{1}{2} \{ |z|^n + 1 \} \max_{|z|=1} |P(z)| \}$$

for every z with $|z| \ge 1$. Taking $z = Re^{i\theta}$, so that $|z| = R \ge 1$, we get

$$|P(Re^{i\theta})| \le \frac{1}{2}(R^n+1)\max_{|z|=1}|P(z)|,$$

which in particular gives inequality (1.6).

As a refinement of Theorem 1.2, we next prove the following theorem, which provides a compact generalization of inequalities (1.7) and (1.8).

journal of inequalities in pure and applied mathematics

Theorem 1.3. If $P \in P_n$, and $P(z) \neq 0$ in |z| < 1 then for $|z| \ge 1$,

(1.17)
$$|B[P(z)]|$$

$$\leq \frac{1}{2} \left[\{ |B[z^n]| + |\lambda_0| \} \max_{|z|=1} |P(z)| - \{ |B[z^n]| - |\lambda_0| \} \min_{|z|=1} |P(z)| \right]$$

Equality holds for the polynomial having all zeros on the unit disk.

Substituting for B[P(z)] in inequality (1.17), we get for $|z| \ge 1$,

$$(1.18) \quad \left| \lambda_0 P(z) + \lambda_1 \left(\frac{nz}{2} \right) P'(z) + \lambda_2 \left(\frac{nz}{2} \right)^2 \frac{P''(z)}{2} \right| \\ \leq \frac{1}{2} \left[\left\{ \left| \lambda_0 z^n + \lambda_1 \left(\frac{nz}{2} \right) n z^{n-1} + \lambda_2 \left(\frac{nz}{2} \right)^2 \frac{n(n-1)}{2} z^{n-2} \right| + |\lambda_0| \right\} \max_{|z|=1} |P(z)| \\ - \left\{ \left| \lambda_0 z^n + \lambda_1 \left(\frac{nz}{2} \right) n z^{n-1} + \lambda_2 \left(\frac{nz}{2} \right)^2 \frac{n(n-1)}{2} z^{n-2} \right| - |\lambda_0| \right\} \min_{|z|=1} |P(z)| \right],$$

where λ_0 , λ_1 and λ_2 are such that all the zeros of u(z) defined by (1.10) lie in (1.11). *Remark* 3. Inequality (1.7) is a special case of inequality (1.18), if we choose $\lambda_0 = 0 = \lambda_2$, and inequality (1.8) immediately follows from it when $\lambda_1 = 0 = \lambda_2$.

If $P \in P_n$ is a self-inversive polynomial, that is, if $P(z) \equiv Q(z)$, where $Q(z) = z^n \overline{P(1/\overline{z})}$, then [10, 16],

(1.19)
$$\max_{|z|=1} |P'(z)| \le \frac{n}{2} \max_{|z|=1} |P(z)|$$

Lastly, we prove the following result which includes inequality (1.19) as a special case.

in pure and applied mathematics

Theorem 1.4. If $P \in P_n$ is a self-inversive polynomial, then for $|z| \ge 1$,

(1.20)
$$|B[P(z)]| \le \frac{1}{2} \{|B[z^n]| + |\lambda_0|\} \max_{|z|=1} |P(z)|.$$

The result is best possible and equality holds for $P(z) = z^n + 1$. Substituting for B[P(z)], we have for $|z| \ge 1$,

(1.21)
$$\left| \lambda_0 P(z) + \lambda_1 \left(\frac{nz}{2} \right) P'(z) + \lambda_2 \left(\frac{nz}{2} \right)^2 \frac{P''(z)}{2} \right|$$

 $\leq \frac{1}{2} \left\{ \left| \lambda_0 z^n + \lambda_1 \left(\frac{nz}{2} \right) n z^{n-1} + \lambda_2 \left(\frac{nz}{2} \right)^2 \frac{n(n-1)}{2} z^{n-2} \right| + |\lambda_0| \right\} \max_{|z|=1} |P(z)|,$

where λ_0, λ_1 and λ_2 are such that all the zeros of u(z) defined by (1.10) lie in (1.11). *Remark* 4. If we choose $\lambda_0 = 0 = \lambda_2$ in inequality (1.21), we get

$$|P'(z)| \le \frac{n}{2} |z|^{n-1} \max_{|z|=1} |P(z)|, \text{ for } |z| \ge 1,$$

from which inequality (1.19) follows immediately.

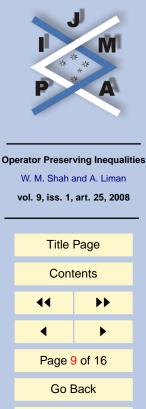

Also if we take $\lambda_1 = 0 = \lambda_2$ in inequality (1.21), we obtain the following:

Corollary 1.5. If $P \in P_n$ is a self-inversive polynomial, then

(1.22)
$$|P(z)| \le \frac{|z|^n + 1}{2} \max_{|z|=1} |P(z)|, \quad for \ |z| \ge 1.$$

The result is best possible and equality holds for the polynomial $P(z) = z^n + 1$. Inequality (1.22) in particular gives

$$\max_{|z|=R>1} |P(z)| \le \frac{R^n + 1}{2} \max_{|z|=1} |P(z)|$$

2. Lemmas

For the proofs of these theorems we need the following lemmas. The first lemma follows from Corollary 18.3 of [8, p. 65].

Lemma 2.1. If all the zeros of a polynomial P(z) of degree n lie in a circle $|z| \le 1$, then all the zeros of the polynomial B[P(z)] also lie in the circle $|z| \le 1$.

The following two lemmas which we need are in fact implicit in [12, p. 305]; however, for the sake of completeness we give a brief outline of their proofs.

Lemma 2.2. If $P \in P_n$, and $P(z) \neq 0$ in |z| < 1, then

(2.1)
$$|B[P(z)]| \le |B[Q(z)]| \text{ for } |z| \ge 1,$$

where $Q(z) = z^n \overline{P(1/\overline{z})}$.

Proof of Lemma 2.2. Since $Q(z) = z^n \overline{P(1/\overline{z})}$, therefore |Q(z)| = |P(z)| for |z| = 1 and hence Q(z)/P(z) is analytic in $|z| \leq 1$. By the maximum modulus principle, $|Q(z)| \leq |P(z)|$ for $|z| \leq 1$, or equivalently, $|P(z)| \leq |Q(z)|$ for $|z| \geq 1$. Therefore, for every β with $|\beta| > 1$, the polynomial $P(z) - \beta Q(z)$ has all its zeros in $|z| \leq 1$. By Lemma 2.1, the polynomial $B[P(z) - \beta Q(z)] = B[P(z)] - \beta B[Q(z)]$ has all its zeros in $|z| \leq 1$.

$$|B[P(z)]| \le |B[Q(z)]|, \text{ for } |z| \ge 1.$$

This proves Lemma 2.2.

Lemma 2.3. If $P \in P_n$, then for $|z| \ge 1$,

(2.2)
$$|B[P(z)]| + |B[Q(z)]| \le \{|B[z^n]| + |\lambda_0|\} \max_{|z|=1} |P(z)|,$$

where $Q(z) = z^n \overline{P(1/\overline{z})}$.

journal of inequalities in pure and applied mathematics

issn: 1443-5756

Proof of Lemma 2.3. Let $M = \max_{|z|=1} |P(z)|$, then $|P(z)| \le M$ for $|z| \le 1$. If λ is any real or complex number with $|\lambda| > 1$, then by Rouche's theorem, $P(z) - \lambda M$ does not vanish in $|z| \le 1$. By Lemma 2.2, it follows that

(2.3)
$$|B[P(z) - M\lambda]| \le |B[Q(z) - M\lambda z^n]|, \quad \text{for } |z| \ge 1.$$

Using the fact that *B* is linear and $B[1] = \lambda_0$, we have from (2.3)

(2.4)
$$|B[P(z) - M\lambda\lambda_0]| \le |B[Q(z)] - M\lambda B[z^n]|, \text{ for } |z| \ge 1.$$

Choosing the argument of λ , which is possible by (1.14) such that

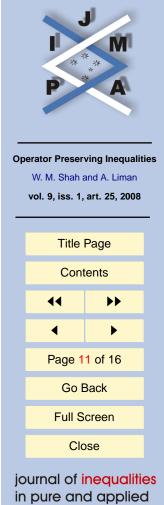

$$|B[Q(z)] - M\lambda B[z^{n}]| = M|\lambda| |B[z^{n}]| - |B[Q(z)]|,$$

we get from (2.4)

(2.5)
$$|B[P(z)]| - M|\lambda||\lambda_0| \le M|\lambda||B[z^n]| - |B[Q(z)]|$$
 for $|z| \ge 1$.
Making $|\lambda| \to 1$ in (2.5) we get

$$|B[P(z)]| + |B[Q(z)]| \le \{|B[z^n]| + |\lambda_0|\} M$$

which is (2.2) and Lemma 2.3 is completely proved.

3. Proofs of the Theorems

Proof of Theorem 1.1. If P(z) has a zero on |z| = 1, then $m = \min_{|z|=1} |P(z)| = 0$ and there is nothing to prove. Suppose that all the zeros of P(z) lie in |z| < 1, then m > 0, and we have $m \le |P(z)|$ for |z| = 1. Therefore, for every real or complex number λ with $|\lambda| < 1$, we have $|m\lambda z^n| < |P(z)|$, for |z| = 1. By Rouche's theorem, it follows that all the zeros of $P(z) - m\lambda z^n$ lie in |z| < 1. Therefore, by Lemma 2.1, all the zeros of $B[P(z) - m\lambda z^n]$ lie in |z| < 1. Since B is linear, it follows that all the zeros of $B[P(z)] - m\lambda B[z^n]$ lie in |z| < 1, which gives

(3.1) $m|B[z^n]| \le |B[P(z)]|, \text{ for } |z| \ge 1.$

Because, if this is not true, then there is a point $z = z_0$, with $|z_0| \ge 1$, such that

 $(m|B[z^n]|)_{z=z_0} > (|B[P(z)]|)_{z=z_0}.$

We take $\lambda = (B[P(z)])_{z=z_0} / (mB[z^n])_{z=z_0}$, so that $|\lambda| < 1$ and for this value of λ , $B[P(z)] - m\lambda B[z^n] = 0$ for $|z| \ge 1$, which contradicts the fact that all the zeros of $B[P(z)] - m\lambda B[z^n]$ lie in |z| < 1. Hence from (3.1) we conclude that

 $|B[P(z)]| \ge |B[z^n]| \min_{|z|=1} |P(z)|, \text{ for } |z| \ge 1,$

which completes the proof of Theorem 1.1.

Proof of Theorem 1.2. Combining Lemma 2.2 and Lemma 2.3 we have

$$2|B[P(z)]| \le |B[P(z)]| + |B[Q(z)]| \\ \le \{|B[z^n]| + |\lambda_0|\} \max_{|z|=1} |P(z)|$$

which gives inequality (1.15) and Theorem 1.2 is completely proved.

issn: 1443-5756

Proof of Theorem 1.3. If P(z) has a zero on |z| = 1 then $m = \min_{|z|=1} |P(z)| = 0$ and the result follows from Theorem 1.2. We suppose that all the zeros of P(z) lie in |z| > 1, so that m > 0 and

(3.2)
$$m \le |P(z)|, \text{ for } |z| = 1.$$

Therefore, for every complex number β with $|\beta| < 1$, it follows by Rouche's theorem that all the zeros of $F(z) = P(z) - m\beta$ lie in |z| > 1. We note that F(z) has no zeros on |z| = 1, because if for some $z = z_0$ with $|z_0| = 1$,

$$F(z_0) = P(z_0) - m\beta = 0,$$

then

$$|P(z_0)| = m|\beta| < m$$

which is a contradiction to (3.2). Now, if

$$G(z) = z^n \overline{F(1/\bar{z})} = z^n \overline{P(1/\bar{z})} - \bar{\beta}mz^n = Q(z) - \bar{\beta}mz^n,$$

then all the zeros of G(z) lie in |z| < 1 and |G(z)| = |F(z)| for |z| = 1. Therefore, for every γ with $|\gamma| > 1$, the polynomial $F(z) - \gamma G(z)$ has all its zeros in |z| < 1. By Lemma 2.1 all zeros of

$$B[F(z) - \gamma G(z)] = B[F(z)] - \gamma B[G(z)]$$

lie in |z| < 1, which implies

(3.3)
$$B[F(z)] \le B[G(z)], \text{ for } |z| \ge 1.$$

Substituting for F(z) and G(z), making use of the facts that B is linear and $B[1] = \lambda_0$, we obtain from (3.3)

(3.4)
$$|B[P(z)] - \beta m \lambda_0| \le |B[Q(z)] - \bar{\beta} m B[z^n]|, \text{ for } |z| \ge 1.$$

Choosing the argument of β on the right hand side of (3.4) suitably, which is possible by (3.1), and making $|\beta| \rightarrow 1$, we get

$$|B[P(z)]| - m|\lambda_0| \le |B[Q(z)]| - m|B[z^n]|, \quad \text{for } |z| \ge 1.$$

This gives

(3.5)
$$|B[P(z)]| \le |B[Q(z)]| - \{|B[z^n]| - \lambda_0\} m, \text{ for } |z| \ge 1.$$

Inequality (3.5) with the help of Lemma 2.3, yields

$$2|B[P(z)]| \le |B[P(z)]| + |B[Q(z)]| - \{|B[z^n]| - \lambda_0\} m$$

$$\le \{|B[z^n]| + \lambda_0\} \max_{|z|=1} |P(z)| - \{|B[z^n]| - \lambda_0\} \min_{|z|=1} |P(z)|, \text{ for } |z| \ge 1,$$

which is equivalent to (1.17) and this proves Theorem 1.3 completely.

Proof of Theorem 1.4. Since P(z) is a self-inversive polynomial, we have

$$P(z) \equiv Q(z) = z^n \overline{P(1/\overline{z})}.$$

Equivalently

(3.6) B[P(z)] = B[Q(z)].

Lemma 2.3 in conjunction with (3.6) gives

$$2|B[P(z)]| \le \{|B[z^n]| + \lambda_0\} \max_{|z|=1} |P(z)|,$$

which is (1.20) and this completes the proof of Theorem 1.4.
