Course 424

Group Representations IIIa

Dr Timothy Murphy

Seminar Room Thursday, 17 June 1999 14:30–16:30

Answer as many questions as you can; all carry the same number of marks.
In this exam, 'Lie algebra' means Lie algebra over $\mathbb{R}$, *and 'representation' means* finite-dimensional representation over $\mathbb{C}$.

1. Define the *exponential* e^X of a square matrix X.

   Determine e^X in each of the following cases:

$$X = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, \quad X = \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}, \quad X = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix},$$
$$X = \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix}, \quad X = \begin{pmatrix} 1 & -1 \\ 1 & 1 \end{pmatrix}, \quad X = \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix}.$$

   Which of these 6 matrices X are themselves expressible in the form $X = e^Y$, where Y is a real matrix? (Justify your answers in all cases.)

2. Define a *linear group*, and a *Lie algebra*; and define the Lie algebra $\mathscr{L}G$ of a linear group G, proving that it is indeed a Lie algebra.

   Define the *dimension* of a linear group; and determine the dimensions of each of the following groups:

$$\mathbf{SO}(n), \mathbf{SU}(n), \mathbf{SL}(n, \mathbb{R}), \mathbf{Sp}(n)?$$

Continued overleaf

3. Determine the Lie algebras of $\mathbf{SU}(2)$ and $\mathbf{SO}(3)$, and show that they are isomomorphic.

   Show that the 2 groups themselves are *not* isomorphic.

4. Determine the Lie algebra of $\mathbf{SL}(2, \mathbb{R})$; and show that this Lie algebra $\mathbf{sl}(2, \mathbb{R})$ has just 1 simple representation of each dimension $1, 2, 3, \ldots$.

5. Show that there are just two Lie algebras over $\mathbb{R}$ of dimension 2 (up to isomorphism); and give two linear groups having these as their Lie algebras.
