School of Mathematics

Course 221 — Analysis (SF Mathematics)

Lecturer: Dr. D.R. Wilkins

Requirements/prerequisites:

Duration: 24 weeks

Number of lectures per week: 3

Assessment: several assignments, providing 10% of the credit for the course

End-of-year Examination: One 3-hour examination

Description: See http://www.maths.tcd.ie/~dwilkins/Courses/221/ for more detailed information.

- Section 1: Sets Functions and Countability. Sets; relations; functions between sets; injective, surjective and bijective functions; inverse functions; countability.
- Section 2: Metric Spaces. Euclidean spaces; definition of a metric space; definition and basic properties of convergence and limits for sequences of points in a metric space; definition and basic properties of continuity for functions between metric spaces; open and closed sets in metric spaces; continuous functions and open and closed sets; homeomorphisms.
- Section 2: Analysis in Euclidean Spaces. Euclidean spaces; definition and basic properties of convergence and limits for sequences of points in Euclidean spaces; definition and basic properties of continuity for functions between subsets of Euclidean spaces; uniform convergence; open and closed sets in Euclidean spaces.
- Section 3: Complete Metric Spaces, Normed Vector Spaces and Banach Spaces. the Least Upper Bound Principle; convergence of bounded monotonic sequences of real numbers; upper and lower limits; Cauchy's Criterion for Convergence; the Bolzano-Weierstrass Theorem; complete metric spaces; normed vector spaces; bounded linear transformations; spaces of bounded continuous functions; the Contraction Mapping Theorem; Picard's Theorem; the completion of a metric space.
- Section 4: Topological Spaces. Topological spaces; Hausdorff spaces; subspace topologies; continuous functions between topological spaces; homeomorphisms; sequences and convergence; neighbourhoods, closures and interiors; product topologies; cut and paste constructions; identification maps and quotient topologies; connectedness.
- Section 5: Compact Spaces. Definition and basic properties of compactness; compact metric spaces; the Lebesgue Lemma; uniform continuity; the equivalence of norms on a finite-dimensional vector space.
- Section 6: The Extended Real Number System. The extended real line; summation of countable sets; summable functions.

2006-07

- Section 7: Measure Spaces. Lebesgue outer measure; outer measures; measure spaces; Lebesgue measure on Euclidean spaces; basic properties of measures.
- Section 8: The Lebesgue Integral. Measurable functions; integrals of measurable simple functions; the definition of the Lebesgue integral; Lebesgue's Dominated Convergence Theorem; the relationship between the Lebesgue and Riemann integrals.
- Section 9: Signed Measures and the Radon-Nikodym Theorem. Signed measures; the Hahn Decomposition Theorem; the Jordan Decomposition of a Signed Measure; Absolute continuity of measures; the Radon-Nikodym Theorem.

October 3, 2007
