

MA1123 - Solutions 5

Problem (10 - p234). Find the point in the first quadrant of the curve $y = x^{-2}$ such that a rectangle with sides on the coordinate axes and a vertex P has the smallest possible perimeter.

Solution: The perimeter function is:

$$\begin{aligned}f(x, y) &= 2x + 2y \\f(x) &= 2x + \frac{2}{x^2} \\ \Rightarrow f'(x) &= 2 - \frac{4}{x^3} \\ \Rightarrow f''(x) &= \frac{4}{x^4}\end{aligned}$$

Since $f''(x) > 0$ in the first quadrant, the solution to $f'(x) = 0$ will give us the minimum, which is $P = (2^{1/3}, 2^{-2/3})$ \square

Problem (14 - p234). A wire of length 12cm can be bent into a circle, square, or cut into two pieces to make both. Find the length of wire used for the circle which a) minimises and b) maximises the enclosed area.

Solution: Let the square have length a and the circle have radius r . Then the function we want to maximise is $f(a, r) = a^2 + \pi r^2$ subject to constraint $12 = 4a + 2\pi r$, so we substitute $a = 3 - \frac{\pi}{2}r$ to get the function:

$$\begin{aligned}f(r) &= (3 - \frac{\pi}{2}r)^2 + \pi r^2 \\ \Rightarrow f'(r) &= -\pi(3 - \frac{\pi}{2}r) + 2\pi r \\ \Rightarrow f''(r) &= \frac{\pi^2}{2} + 2\pi\end{aligned}$$

Since $f'' > 0$, the solution to $f'(r) = 0$ will be a local minimum, and since $f(r)$ is quadratic this is also the global minimum. This is at $r_0 = \frac{6}{4+\pi}$. To determine the global max we must look at the endpoints, $r = 0, a = 0$, which give $r_1 = 0, r_2 = 6/\pi$ when the wire is used entirely for the circle or the square. Now

$$\begin{aligned}f(r = 0) &= 9 \\ f(r = 6/\pi) &= \frac{36}{\pi}\end{aligned}$$

Since $\pi < 4$, we know $\frac{36}{\pi} > \frac{36}{4}$ and so the area is maximised when the wire is used entirely to form a circle. (In general this is the isoperimetric inequality). \square

Problem (30 - p234). A closed cylindrical can is to have a surface area S . Show that the volume is maximised when the height is equal to the diameter of the base.

$$a = 0 \Rightarrow r = \sqrt{\frac{S}{4\pi}}$$

$$r = 0 \Rightarrow a = \sqrt{\frac{S}{6}}$$

$$V(a = 0) = \frac{4}{3}\pi \left(\frac{S}{4\pi}\right)^{3/2}$$

$$V(r = 0) = \left(\frac{S}{6}\right)^{3/2}$$

Numerically checking gives that the volume is maximised when $a = 0$ and the surface area is entirely used for the sphere. (This is the 3d version of the isoperimetric inequality). \square

Q44)

$$a) R(x) = x \cdot p = x \cdot (1000 - x)$$

$$b) P(x) = R(x) - C(x) = x(1000 - x) - (3000 + 20x) \\ = 980x - x^2 - 3000$$

$$c) P'(x) = 980 - 2x = 0 \Rightarrow x = 490$$

$$d) P(490) = 237100 \quad P(0) = -3000 \quad P(500) = 237400$$

$$e) P(p) = 980(1000 - p) - (1000 - p)^2 - 3000$$

$$\frac{dP}{dp} = -980 + 2(1000 - p) = 0$$

$$\Rightarrow p = 510$$

Q46) $C(t, n) = 15 \cdot t + 2,5 n$, n : total gallon of diesel fuel

$t = x/re$, $n = x / (10 - 0,07re)$, x : total distance.

$$\Rightarrow C(x, re) = \frac{15x}{re} + 2,5 \frac{x}{10 - 0,07re}, \text{ total cost}$$

Cost per mile: $c(re) = 15/re + 2,5 / (10 - 0,07re)$

$$\frac{dc}{dre} = -15/re^2 + \frac{(0,07) \cdot 2,5}{(10 - 0,07re)^2}$$

$$\Rightarrow -15(10 - 0,07re)^2 + 2,5 \cdot 0,07re^2 = 0$$

$$\Rightarrow re = 56,1759 \text{ miles/hour}$$

056)

$$a) T(x) = \frac{\sqrt{x^2+1}}{3} + \frac{1-x}{5}$$

$$T'(x) = \frac{1}{3} \frac{x}{\sqrt{x^2+1}} - \frac{1}{5} = 0$$

$$\Rightarrow x = 3/4 \text{ critical point}$$

$$T(0) = 0.533 \quad T(3/4) = 0.466$$

$$T(1) = 0.471$$

$$\Rightarrow x = 3/4 \text{ mi} \rightarrow \text{minimum time}$$

$$b) T(x) = \frac{\sqrt{x^2+1}}{4} + \frac{1-x}{5}$$

$$T'(x) = \frac{1}{4} \frac{x}{\sqrt{x^2+1}} - \frac{1}{5} = 0 \Rightarrow x = 4/3 \text{ mi} \rightarrow \text{end of range}$$

$$T(0) = 0.450$$

$$T(1) = 0.354$$

$$\Rightarrow x = 1 \text{ mi is minimum}$$

$$62) t(x) = \frac{\sqrt{a^2 + (c-x)^2}}{n_1} + \frac{\sqrt{b^2 + x^2}}{n_2}$$

n_1, n_2 : speed of light, constant in uni. medium

$$\frac{dt}{dx} = \frac{1}{n_1} \left[-\frac{(c-x)}{\sqrt{a^2 + (c-x)^2}} + \frac{x}{\sqrt{b^2 + x^2}} \right] = 0$$

$$\Rightarrow (c-x)^2 (b^2 + x^2) = x^2 (a^2 + (c-x)^2)$$

$$\frac{b^2}{x^2} + 1 = \frac{a^2}{(c-x)^2} + 1 \Rightarrow \cos \theta_2 = \cos \theta_1$$

$$\text{for } 0 < \theta_1, \theta_2 < 90 \Rightarrow \boxed{\theta_1 = \theta_2}$$

24

(a)

$$f(x) = \frac{1}{x} - a.$$

$$f'(x) = -\frac{1}{x^2}$$

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$$

$$= x_n - \frac{\frac{1}{x_n} - a}{-\frac{1}{x_n^2}}$$

$$= x_n + x_n - ax_n^2$$

$$= x_n(2 - ax_n)$$

(b) to approximate $\frac{1}{17}$.

$$\text{Let } x_1 = \frac{1}{20} = .05$$

$$x_2 = .05(2 - 17(.05))$$

$$= .0575$$

$$x_3 = .0575(2 - 17(.0575))$$

$$= .0588 \quad \text{correct to 4 d.p.}$$

Note correct answer .0588235 -

11 False Rolle's theorem also need $f'(x)$ to exist on (a, b) .

Counterexample  no tangent.

12 True. $f'(c) = \frac{f(b) - f(a)}{b - a} =$ Average rate of change

13 False $f(x) = 2x$ $g(x) = 3x$.

$$\begin{aligned} f'(x) &= 2 & g'(x) &= 3 \\ f' - g' &= \text{constant} \\ f &\neq g \end{aligned}$$

14 True We used the M.V.Th. to prove Theorem 3.1.2.

15 $f(x) = \tan x$ $f'(x) = \sec^2 x = \frac{1}{\cos^2 x}$
 $\neq 0$ on $(0, \pi)$

But $f(x)$ is not diff at $\pi/2$.

16 $f(x) = x^{2/3}$ $a = -1$ $b = 8$.
 $f(a) = 1$ $f(b) = 4$.
 $\frac{f(b) - f(a)}{b - a} = \frac{4 - 1}{8 - (-1)} = \frac{1}{3}$.

$$\begin{aligned} f'(x) &= \frac{2}{3} x^{-1/3} = \frac{1}{3} \Rightarrow x^{1/3} = \frac{1}{2} \\ &\Rightarrow x^{1/3} = 2 \\ &\Rightarrow x = 8 \end{aligned}$$

But $f(x)$ is not diff at $x = 0$.

17 (a) Two x -intercepts of $f(x)$

$$\Rightarrow f(a) = f(b) = 0.$$

By Rolle's Thm $\exists c \in (a, b)$
with $f'(c) = 0$

(b) $y = -x^2 + 4$ $y = 0$ at $x = \pm 2$

$$\frac{dy}{dx} = -2x = 0 \text{ at } x = 0.$$

$y = \sin x$ $y = 0$ at $x = 0, \pi$

$$\frac{dy}{dx} = \cos x = 0 \text{ at } x = \frac{\pi}{2}$$

22

$$f(x) = 3x^4 + x^2 - 4x$$

$$f(0) = 0 \quad f(1) = 0$$

By Rolle's Thm $\exists c \in (0, 1)$

with $f'(c) = 0$ $f(x) = 12x^3 + 2x - 4$

26

(a)

$$f(x) - f(y) = f'(c)(x - y)$$

$$|f(x) - f(y)| = |f'(c)| |x - y|$$

$$\geq M |x - y|.$$

(b) Let $f(x) = \tan x$ on $(-\frac{\pi}{2}, \frac{\pi}{2})$

$$f'(x) = \frac{1}{\cos^2 x} \geq 1 \quad \text{on } (-\frac{\pi}{2}, \frac{\pi}{2})$$

$$\therefore |\tan x - \tan y| \geq |x - y|$$

all x, y in $(-\frac{\pi}{2}, \frac{\pi}{2})$

(c) If y is in $(-\frac{\pi}{2}, \frac{\pi}{2})$ so is $-y$.

$$\text{and } \tan(-y) = \frac{\sin(-y)}{\cos(y)} = -\tan y.$$

$$\text{Hence } |\tan x - \tan(-y)| \geq |x - (-y)|.$$

$$\text{ie } |\tan x + \tan y| \geq |x + y|.$$
