

231 Tutorial Sheet 8¹²

2 December 2005

Useful facts:

- The vector potential: on a domain with no internal boundary, a smooth vector field \mathbf{F} with zero divergence has a vector field \mathbf{A} so that $\mathbf{F} = \nabla \times \mathbf{A}$.
- Hodge decomposition: under some conditions, a general smooth vector field can be written in the form $\mathbf{F} = \nabla \times \mathbf{A} + \nabla \phi$ for some smooth vector field \mathbf{A} and some scalar field ϕ .

Questions

1. Obtain a vector potential for the solenoidal vector field: $\mathbf{F} = x\mathbf{i} + y\mathbf{j} - 2z\mathbf{k}$
2. Obtain a vector potential for the solenoidal vector field: $\mathbf{F} = e^x\mathbf{k}$.
3. Find a Hodge decomposition for the vector field $\mathbf{F} = -y\mathbf{i} + x\mathbf{j} + z\mathbf{k}$.
