442 Tutorial Sheet 6¹

22 February 2005

1. (3) The equation of state is often written in *adiabatic form*

$$p = (\gamma - 1)\rho \tag{1}$$

where p is pressure and ρ is density and $0 \le \gamma \le 2$ is the *adiabatic index* with $\gamma = 0$ for dust and $\gamma = 4/3$ for radiation. Calculate $\rho(a)$ for general γ . k = 0 calculate a(t). Find the age of the universe for k = 0 and general γ .

- 2. (2) In the notation of the previous question, find γ so that the expansion rate is constant. With this value of γ find a(t) for k = 1 and k = -1.
- 3. (2) In the same notation, show

$$\dot{\Omega} = (2 - 3\gamma)H\Omega(1 - \Omega) \tag{2}$$

Define the logarithmic scale factor $s = \log a$ and write an equation for $d\Omega/ds$. Notice that this formula gives a clear idea of how Ω behaves.
